Here are the scanned analytical results from the latest round of compliance monitoring (January 1 – June 30, 2015) conducted in Flint. They were scanned for the purpose of responding to a Freedom of Information Act request.

I believe you already have a copy of the correspondence from our Lansing District Office notifying the city of Flint of the compliance determination that was based on these results.

If you need more information, contact Adam Rosenthal.

Subject: Re: Flint Corrosion Control?

Pat,
You are correct, I received a call from Miguel regarding his concerns with the lead/copper sampling procedure from lead services and how he believes it is skewing down the lead level results from sites with lead services. I briefed Steve on the call and we can discuss in more detail next Tues.

> Pat,

As we discussed, Flint is not practicing corrosion control treatment at the WTP. They are conducting lead & copper monitoring at 100 locations. WQ monitoring is also being conducted. The first round of samples after switch-over (July 1, 2014 – Dec 31, 2014) had 90th percentile results as follows: Lead: 6 ppb, Copper 110 ppb The second round of samples (Jan 1, 2015 – June 30, 2015) is underway with approx. 20 of the 100 sample site results in. The highest lead result out of the 20 received thus far is 13 ppb.

Cc: Rennaker, Joanne (DEQ); Rosenthal, Adam (DEQ); Cook, Pat (DEQ)
Subject: RE: City of Flint - Lead & Copper - FOIA Request

Mike,

When we discussed this matter earlier, I believed the request was limited to correspondence generated between January 1 and June 30, 2015, that met the conditions spelled out in their FOIA request. In reading your message below, I now suspect that they want any correspondence (with the designated entities) that is in regard to the lead and copper results from samples collected between January 1 and June 30, 2015, even if the correspondence was generated after that time frame. It appears to me the dates are bracketing the period of time for the lead and copper monitoring, not the time frame for correspondence regarding those results. So if we have correspondence with these entities (electronic or otherwise) dated this month (July 2015) that addresses results from samples collected in the first six months of 2015, we should provide them with a copy.

Richard

Subject: City of Flint - Lead & Copper - FOIA Request

The LDO has received a FOIA request from the ACLU for information concerning lead and copper records from the city of Flint. Specific information being requested is in 2 main parts. First.. provide a copy of all documented (electronic and hard copy) records of individual lead/copper sample results conducted in the city of Flint from January 1, 2015 through June 30th. Second...provide a copy of all communications (including electronic) between DEQ staff

with any city official or employee, outside contractors or consultants, and any US EPA employee regarding lead/copper water tests conducted in the city of Flint from January 1, 2015 through June 30th, 2015.

The initial deadline was July 30, 2015; however, our request for a 10-day extension to August 13, 2015 was approved. I will work with Joanne and Adam on compiling the information pertaining to the sample results/locations and hard copies of written correspondence. Also all e-mails (not internal) will need to be compiled as part of meeting this FOIA request. Richard and I reviewed his record of "sent" and "received" emails in Outlook earlier today and we believe that most of them are accounted for, however, there may be additional PB/CU electronic communication sent from other staff...including me. Each one of you should check on this for verification. We will most likely need to meet early in the week of August 10th to be verify that all of the information has been compiled prior to sending out the requested information.

> Prof. Marc Edwards of Virginia Tech university has been leading a research project to conduct an independent study of lead in Flint's water. Working with a group of city residents, they have been collecting water samples from homes throughout the city. The study is still under way, but the results so far have been so disturbing that VT has begun posting results on the web in order to alert residents about how serious the problem may be.
>
> This is what VT is reporting:

Over the weekend we analyzed another 72 lead samples collected by Flint residents and mailed to VT. For the 120 samples analyzed to date, ***forty two percent were over 5 ppb,*** *which suggests a serious lead in water problem according to our experience and criteria. Twenty-three (20% of those collected) also exceeded 15 ppb lead, suggesting a serious lead in water problem.* ***That is, the Flint Citizen Science study to date, is finding results worse than the EPA standard which is applied to sampling "worst case" homes.*** *The highest lead sampled in first draw so far was 158 ppb, and the highest sample after 45 second flushing is 1051 ppb. Six of 120 homes sampled (5%), had over 15 ppb lead even after 2 minutes of continuous flushing.* ***The 90%'ile lead level in the Flint Water Study is currently 30 ppb, which is double the EPA standard applied to "worst case" homes, and in a range where water consumption has caused lead poisoning in children and adverse pregnancy outcomes.*** *Needless to say, these data are very worrisome.*

Here is the website containing the information.

I am writing about this for a story that will be posted tomorrow. If the city chooses to respond, I need to hear back from you by the end of the day today, Aug. 31.

Sincerely,

Curt Guyette

Subject: Technical Advisory Meeting

Technical Advisory Team,

I am writing to inform everyone that we have scheduled the next Technical Advisory Committee meeting to be Wednesday October 7th, 2015 from 2:00 – 4:30 pm. We are extending invitations to Marc Edwards of Virginia Tech along with two lead experts from the EPA (Darren Lytle & Michael Schock) to become a part of the technical team and we are hopeful that they will all be present at the upcoming meeting.

At the meeting we will discuss an overview of the City water system, compliance with the Safe Drinking Water Act, lead concerns, corrosion control, water testing, public education, capital improvement plans, the KWA pipeline, and next steps.

I will forward a specific location and agenda in the near future but we are firmly committing to the time and date. As with previous meetings we look forward to this group having positive dialogue that will benefit the community.

Thank you,

Subject: resignation

Mr. Wurfel,

As I read your statements today in the newspaper, your caring for the citizens of Flint and how that just didn't come through in your communications, I have to wonder what you were thinking. Your rudeness and arrogance towards citizens and experts was truly astounding. Given your words and demeanor, why would anyone think you care about the people of Flint or for that matter the citizens of Michigan? I am glad you have resigned as I don't think you had the welfare of the citizens as your top priority. I hope you take with you to your next job, whatever it might be, a new respect, compassion and understanding for people. I hope you have learned to listen attentively to what others say and have empathy for their plight - that our goal as humans is to help others in need not dismiss them and malign them. I hope you have grown as a person and realize we are all in this together.

Sincerely,

Ruth Wilson

Subject: RE: 2014 Communications planning: NEED YOUR HELP

Michael,

Two notes on the second page.

1. The item labeled "Brent Run Landfill" should be labeled "Richfield Landfill." Also, several staff from WRD worked with OWMRP staff to successfully resolve soil erosion issues that affected a created wetland at this site.

2. Karegnondi Water Authority. Although construction of the water intake structure was permitted under Part 325 by our colleagues in Bay City, the Lansing District is taking the lead on reviewing the Part 301/303/31 (floodplains) permit for the pump stations and raw water main across all 4 counties. The project includes 80 miles of pipe crossing 55 waterways and 50 wetlands. Several pre-application meetings were held, which allowed WRD staff to quickly complete the Public Notice for this project and schedule the four Public Hearings requested by the applicant.

Subject: 2014 Communications planning: NEED YOUR HELP
Importance: High

Greetings, all. We're moving toward a great 2014, where we will be doing more strategic communication and impactful storytelling.

As we prepare the departmental communications plan, I need your input. The Director has tasked me with collecting 2013 Accomplishments from each of the divisions and districts.

I don't need a book. Half a dozen of your top accomplishments on the year would be very helpful. One liner with a few sentences.

I need these by Dec. 6, in preparation for an off-site planning meeting Dec. 9.

If you have questions, please get in touch with me directly. THANK YOU, and happy holidays.

Brad Wurfel

Communications Director

Michigan Department of Environmental Quality

Our sampling of 252 homes demonstrates a high lead in water risk: Flint should be failing to meet the EPA Lead and Copper Rule

September 8, 2015 Articles, Research Updates epa lead and copper rule, flint water, lead, lead filter, lead in water, mdeq, public health concern

Over the weekend, we analyzed all samples shipped to Virginia Tech from Flint to date. Flint residents have already returned an **astonishing 84%** of the sample kits we sent out (252 out of 300 samples). We will continue to analyze water samples as they are returned. However, mathematically, even if the remaining 48 samples returned have non-detectable lead, our conclusion will not change — **FLINT HAS A VERY SERIOUS LEAD IN WATER PROBLEM.**

Forty percent (40.1%) of the

Forty percent (40.1%) of the first draw samples are over 5 parts per billion (ppb). That is, 101 out of 252 water samples from Flint homes had first draw lead more than 5 ppb. Even more worrisome, given that we could not target "worst case" homes with lead plumbing that are required for EPA sampling, **Flint's 90%'ile lead value is 25 ppb in our survey. This is over the EPA allowed level of 15 ppb that is applied to high risk homes.** This is a serious concern indeed. **Several samples exceeded 100 ppb, and one**

This is a serious concern indeed. **Several samples exceeded 100 ppb, and one sample collected after 45 seconds of flushing exceeded 1000 ppb.**

We now advise Flint consumers to heed EPA information that advises consumers on how to avoid adverse health effects from exposure to excessive lead in drinking water. The main concern is related to water used for drinking or cooking. With the exception of one home that we sampled which had astronomical levels of lead, the levels of lead

lead in drinking water. The main concern is related to water used for drinking or cooking. With the exception of one home that we sampled which had astronomical levels of lead, the levels of lead detected in Flint were safe for bathing, showering, toilet flushing and watering lawns/gardens.

Until further notice, **we recommend that Flint tap water only be used for cooking or drinking if one of the following steps are implemented:**

- Treat Flint tap water with a filter certified to remove lead (look for certification by the National Sanitation Foundation (NSF) that it removed lead on the label), or
- Flush your lines continuously at the kitchen tap, for 5 minutes at a high flow rate (i.e. open your faucet all the way), to clean most of the lead out of your pipes and the lead service line, before collecting a volume of water for cooking or drinking. Please note that the water needs to be

●●●○○ Verizon LTE 1:52 PM
flintwaterstudy.org

drinking. Please note that the water needs to be flushed 5 minutes every time before you collect water for cooking or drinking. For convenience, you can store water in the refrigerator in containers, to reduce the need to wait for potable water each time you need it.

We do not issue this warning lightly, and note that our concern is based on several lines of evidence. First, scientifically, we ***predicted*** based on past research that the Flint River water chemistry

We do not issue this warning lightly, and note that our concern is based on several lines of evidence. First, scientifically, we ***predicted*** based on past research that the Flint River water chemistry would create a serious lead in water problem. Second, ***we confirmed the very high corrosivity of the Flint River water for lead in our laboratory testing at Virginia Tech.*** Third, for some reason that no one has yet explained to us, ***the Flint River water*** *was introduced* ***into the pipe distribution system without any measures (or even a plan) to***

●●●○○ Verizon LTE 1:52 PM
flintwaterstudy.org

distribution system without any measures (or even a plan) to reduce its corrosivity. We are therefore very perplexed by recent MDEQ assertions that the situation in Flint is normal. Finally, we have the results of our survey of 252 homes conducted with the assistance of Flint consumers. Because of the very serious and permanent health damage that arises from lead exposure, we feel that this problem **requires immediate public health warnings and intervention– we provide that for Flint consumers in this report.**

Another mystery that must be examined very carefully in the days and weeks ahead: **How is it possible, that Flint "passed" the official EPA Lead and Copper Rule sampling overseen by MDEQ?** In our experience, following the EPA site selection criteria targeting homes with the highest risk for lead, the MDEQ sampling should have found much worse results than our sampling. Instead, MDEQ is asserting that the lead levels in Flint are much lower. Hence, we call on the U.S. EPA and others, to conduct a detailed audit of the 2014 and 2015 LCR

audit of the 2014 and 2015 LCR sampling round overseen by MDEQ in Flint, to determine if it was conducted consistent with requirements of the law.

Subject: Preliminary & Deliberative: Not Subject to FOIA: Flint visit

George,
I did not see my name on the attendee list for tomorrow's 10am meeting in Flint. I just wanted to confirm this. I will also need to confirm when you intend to visit the Water Treatment Plant as I should participate in that visit.

Subject: Preliminary and Delibrative - not subject to FOIA - Infographic

Hi Liane and Steve,

Here is the infographic that we mentioned on Tuesday. This infographic has some information about adult exposure and putting it into a risk context.

http://www.michigan.gov/documents/deq/deq-flint-water-2015-10-21_-_Lead_and_your_Body_-_Flint_-_no_background_504124_7.pdf?20151030113128

Do you think this infographic will answer the questions you have been getting about adult exposure? Do you think a factsheet with more detail about adult risk is needed?

Thank you,
Kory Groetsch, MS , Manager

Dear Drinking Water Laboratory Client,

A PDF file containing your analytical results has been attached to this e-mail.

Please do not reply directly to this e-mail. It is an automated account that does not respond to incoming messages.

Please contact the laboratory directly at (517) 335-8184 with questions regarding your report.

Thank you for using the MDEQ Drinking Water Laboratory.

Subject: RE: Eisenhower Elementary School

I think this addressed since the recommendation is to replace the faucet. Cleaning is only suggested if they don't replace the faucet.

Subject: RE: Eisenhower Elementary School

I think we will need to discuss this. If we suggest cleaning we should indicate follow up testing. Many of the faucets that I saw clearly were of an age that the brass was likely 8% (or perhaps even more) of lead.

Subject: Eisenhower Elementary School

Attached is the Eisenhower report with suggested edits (using track changes) by Liane. Please pay close attention to the entered comment as that change is suggested to be applied to several paragraphs throughout the document. I already went through and accepted the changes I made (mostly cleanup work) so this should be easy to look at quickly.

Hi Natasha,

Please see the following link:

http://www.mlive.com/news/flint/index.ssf/2015/12/flint_will_pay_for_independent.html#incart_river_index

I support the city's desire to utilize an outside party to identify lead service lines and to conduct testing. There is however an issue that I want to bring to your attention. I do not show PSI as being certified in the State of Michigan. There are a number of labs that are certified by the State of Michigan and any public water supply is free to use any certified lab. The DEQ would be put in a very awkward position of not recognizing results unless the lab was certified in the State of Michigan.

You may wish to check with PSI to see what their certification status is in the State of Michigan. If they are located outside of the State of Michigan we can provide reciprocal certification based on the certification of their home state but they have to go through the process in order to receive reciprocal certification.

If PSI does not wish to go through the certification process they are free to sub-contract the lab work to any lab certified by the State of Michigan.

I am confident that we can work through this issue, I just want to make sure that we address this before it becomes problematic.

Please feel free to call me if you would like to discuss.

Thank you!

Deidre,
Good talking to you on the phone today. I understand that ORR needs to connect each rule change with a comment made at public hearing (either written or verbal). You asked for the transcript, which we sent you last week. Some comments, however, were only submitted in writing. Today you asked for the relevant written public comments. You also asked me to edit the JCAR Report to indicate who made which comment. I will get this to you as soon as possible.

Subject: RE: 2014-023EQ JCAR Report Submittal

I am reviewing the JCAR Report submitted on June 9th , I am having a difficult time trying to tie the changes in the rules to the public hearing comments. The rule published as proposed in the Michigan Register was 171 pages and the rule submitted with the JCAR report is 113 pages. I thought maybe when I read the public hearing transcript I could tie the changes with the comments, but the USEPA must have submitted written comments? Can you please submit the written comments where DEQ made changes to the rules. Also when changes are made to the rule after public hearing can you be specific regarding who's comment prompted the change.

Please feel free to give me a call to discuss the report.

Agency Report to the
JOINT COMMITTEE ON ADMINISTRATIVE RULES

This form must be completed by the department/agency that has the statutory authority for promulgating the rules. Please send an electronic copy of this form to the Office of Regulatory Reinvention at **orr@michigan.gov**. The ORR will review the document, the newspaper advertisements, and the corresponding rules prior to completing the legal certification of the rules. Please be sure to send to the ORR proofs of publication for the three newspaper advertisements required by MCL 24.242(1). You may mail them or send them as a scanned attachment.

Department

Department of Environmental Quality

Division/agency/bureau:

Office of Drinking Water and Municipal Assistance (ODWMA)

Rule set number (as assigned by ORR)

ORR 2014-023 EQ

Title of rules:

Supplying Water to the Public

1. Name, address, FAX and phone numbers of agency contact person:

Jean Shekter, DEQ, ODWMA, P.O. Box 30241, Lansing, Michigan 48909-7741; Fax: 517-241-1328; Phone: 517-284-6519.

2. Purpose for the proposed rules and background:

The ODWMA is responsible for ensuring that public water supplies serve water meeting state drinking water standards under the Safe Drinking Water Act, 1976 Public Act 399, as amended (Act 399). In order to retain primary enforcement authority for the Public Water System Supervision Program, states must pass laws and adopt rules that are no less stringent than the federal Safe Drinking Water Act. The United States Environmental Protection Agency (USEPA) promulgated amendments to existing federal regulations, Revisions to the Total Coliform Rule (RTCR), and we must adopt those regulations into Michigan's Administrative Rules.

In addition to the RTCR, we are proposing amendments to the cross connection rules in response to a recommendation of the Environmental Advisory Rules Committee to enhance the rules instead of relying on a guidance document. The remainder of the proposed rules update and expand longstanding public water supply requirements. These requirements form a multiple barrier approach to ensure a safe and reliable supply of drinking water to the public, such as providing properly trained and experienced operators, and managing assets to ensure public water supplies achieve and maintain technical, managerial, and financial capacity.

3. Summary of proposed rules:

The RTCR revised the original total coliform rule, promulgated by the USEPA in 1989, and aims to increase public health protection by requiring public water supplies to find and fix potential pathways of fecal contamination into their distribution system.

Cross connection control protects each water supply from backflow so that water of questionable quality is kept out of the public water supply's distribution system. The amendments establish a minimum frequency to test backflow preventers and modifies the requirement for public water supplies to accept backflow preventer results only from individuals certified to test them, starting in 2018.

The operator certification amendments tighten the deadline by which some individuals must submit an application for certification examinations. This will allow for the additional processing necessary with the passage of certification examination fees now in effect as a result of 2011 amendments to the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended.

Asset management rules currently in place require publically owned or operated community water supplies to have a general plan for the waterworks system that includes a capital improvements plan that identifies waterworks system needs for 5-year and 20-year planning periods. The proposed rule clarifies that an asset management program is an integral part of developing an adequate capital improvements plan and requires the phased-in implementation of an asset management program for both publically- and privately-owned community water supplies that serve more than 1,000 people.

Finally, the amendments rescind the rules that require an annual water quality report from nontransient, noncommunity water supplies that are K-12 schools and daycare centers. Much of the information is now reported to the public under later rule amendments. Other information in the report, in many cases, is accessible via electronic means.

4. Name of newspapers and date of publication in newspapers (minimum 3 newspapers of general circulation, representing different parts of the state, one of which must be located in the Upper Peninsula):

The Marquette Mining Journal, January 20, 2015
The Lansing State Journal, January 20, 2015
The Detroit News/Free Press, January 22, 2015

5. Time, date, location and duration of public hearing:

10:00 a.m., February 18, 2015, Patriot Conference Room, Constitution Hall, 525 West Allegan Street, Atrium, North Tower, Lansing, Michigan 48933, 37 minutes.

Date of publication of rules and public hearing notice in *Michigan Register:*

January 15, 2015

6. Provide the link the agency used to post the regulatory impact statement on its website*:*

http://www.michigan.gov/deq/0,4561,7-135-3313_3675_3691-9647--,00.html

7. Agency representative(s) attending hearing (include agency name and title of representative[s]):

All representatives are from the DEQ's ODWMA.

State Drinking Water Administrator:
Liane J. Shekter Smith, Chief

Hearing Officer:
Jaclyn Merchant, Environmental Quality Analyst, Revolving Loan Section

Other Agency representatives:
Richard Benzie, Chief, Field Operations Section
Jason Berndt, Environmental Quality Analyst, Field Operations Section
Paul Brun Del Re, Environmental Quality Analyst, Field Operations Section
Pat Cook, Environmental Engineering Specialist, Field Operations Section
Dana DeBruyn, Chief, Noncommunity and Private Drinking Water Supplies Unit
Kris Dorcy, Environmental Quality Analyst, Environmental Health Section
Carrie Monosmith, Chief, Environmental Health Section
Scott Schmidt, Environmental Quality Analyst, Field Operations Section
Jean Shekter, Environmental Quality Analyst, Field Operations Section

8. Persons submitting letters, comments and testimony of support:

Cardinal, David, 5464 Independence Colony Road, Grand Blanc, Michigan 48439.

Crooks, Jennifer, Michigan Program Manager, submitting comments on behalf of the Ground Water and Drinking Water Branch, and the Office of Regional Counsel, USEPA, Region 5, 77 West Jackson Blvd, Chicago, Illinois 60604.

Kapcia, Matthew, Cross Connection Inspector, ASSE Instructor, 4693 Rochester Road, Troy, Michigan 48085

Lueck, Michael, President, Mid-West Instrument, 6500 Dobry Drive, Sterling Heights, Michigan 48314.

Moore, Charles, Industrial Pretreatment/CCP Supervisor, Oakland County Water Resources Commissioner's Office, One Public Works Drive, Building 95 West, Waterford, Michigan 48328-1907

Roby, Kevin, Cross Connection Specialist, City of Novi, 26300 Lee BeGole Drive, Novi, Michigan 48375.

9. Persons submitting letters, comments and testimony of opposition:

Kendzierski, Scott J., REHS, MS, Director of Environmental Health Services, Health Department of Northwest Michigan, 220 West Garfield Avenue, Charlevoix, Michigan 49720, http://www.nwhealth.org.

Kortman, Mike, Cross Connection Control Program Administrator, Byron-Gaines Utility Authority, 1381 84th Street SE, Byron Center, Michigan 49315

10. Summary of suggestions to modify proposed rules:

This summary includes:

- USEPA comments on RTCR
- RTCR implementation
- Cross connection control rules
- Miscellaneous

USEPA comments on RTCR

The USEPA recommended corrections and clarifications to ensure the proposed rules are as stringent as the federal regulations for RTCR. We agree with each recommendation. The proposed total coliform related rules are changed as recommended:

- Page 7, R 325.10108(c), correct "system" to "supply."
- Page 19, R 325.10401a, Table 1, delete citations in rows under "III. Public notification for variances and exemptions."
- Page 22, R 325.10403(2)(b), include reference to R 325.10705 to R 325,10709.
- Page 27, R 325.10405, Table 1, in row "Total coliform bacteria beginning April 1, 2016," last column, replace citation with the language from the citation R 325.10413(12)(g)(i)(A). This language in the total coliform row is very similar to, but not exactly as, the language in the "Coliform Assessment" row of the same table (page 28), therefore to avoid confusion, we also inserted an applicability clarification in the first column of both rows.
- Page 27, R 325.10405, Table 1, in row "E. coli beginning April 1, 2016," second column, add clarifying phrase "all required" before "repeat."
- Pages 28, R 325.10405, Table 1, add three missing rows "Coliform Assessment, E. coli Assessment, and Seasonal Supply. The requirement to notify the public when violations or situations occur is established elsewhere in the total coliform rule. This consolidated table lists the language that must appear on the public notice. Inserting the three missing lines simply lists the required language on the public notification for these violations and situations.
- Page 46, R 325.10413(12)(g)(iv), correct citation reference to (8)(d).

- Page 60, R 325.10704c(1)(f). The USEPA suggested a change that referred to a federal paragraph number instead of a state rule number. We corrected the corresponding state citation from "paragraphs (a)(5)(i) of this subrule" to the correct state citation "subdivision (e)(iii) of this subrule."
- Page 60, R 325.10704c(3)(a)(ii), correct citation reference from 709 to 704.
- Page 60, R 325.10704c(3)(a)(ii) and (iii), add language that was inserted by the department in the rules in 2009 to clarify when the department could invalidate a sample. The clarifying language was inadvertently omitted when incorporating the RTCR in R 325.10704c(3)(a)(ii) and (iii). We intend to carry the clarification into the new total coliform rules. The clarifications are in the form of examples.
- Page 61, R 325.10704d(1)(d), correct citation references to (6)(a)(iv) and (7)(d).
- Page 62, R 325.10704d(5)(a), correct citation reference to (6). EPA's comment to correct the citation reference to (6) appears to refer to R 325.10704d(1)(d), but that was not their intent. After checking with EPA, it was clear that EPA inadvertently omitted the columns for federal citation 141.854(e) and state citation 704d(5) in the final comments. We made the correction to 704d(5) as EPA intended.
- Page 63, R 325.10704d(6)(a)(v), add "total coliform rule" to clarify.
- Page 64, R 325.10704d(9)(b). Add missing phrase "except as provided…" that references a citation. We agree the reference is necessary and we believe a further clarification is necessary to reiterate that seasonal supplies are not eligible for reduced monitoring. Therefore, after "…beginning April 1, 2016" we added ",except as provided in subrule (3) of this rule. Seasonal supplies shall not reduce to annual monitoring."
- Page 68, R 325.10704h(1)(c), after "conduct 1 round" add "of repeat monitoring" to clarify.
- Page 70, R 325.10704i(2)(d), state that the department will make a determination. We added a sentence to the end of the subdivision (d) to clarify the department's role.
- Page 72, R 325.10708, rephrase confusing language. The USEPA recommended adding a clarifying phrase. Adding the phrase would make a run-on sentence even longer. Therefore, in order to clarify the rule, we broke the rule down into subrules to incorporate the recommendation. The intent is to clarify, not change, the rule requirement.
- Page 87, R 325.10719e(3)(a), correct citation typographical error from 709 to 704.
- Page 97, R 325.10720(4), correct citation typographical error from 709 to 704 and add missing phrase corresponding to analytical methods adopted by reference in R 325.10605.

RTCR implementation

The comments made by Mr. Scott Kendzierski pertain largely to the increased financial burden that local health departments (LHDs) will experience implementing the requirements of the RTCR at the noncommunity water supplies they regulate through a

grant awarded via contract from the DEQ. There is real concern that the LHDs may not be able to meet minimum contractual requirements. Specifically, the commenter believes that noncommunity water supplies will be required to monitor more frequently, there will be a significant increase in the number of sample results to enter into the DEQ noncommunity water supplies database, and the seasonal system requirements will significantly increase their workload without an increase in funding.

Mr. Kendzierski's comments do not directly pertain to the Act 399 revisions, but rather to the resources needed to implement the RTCR when it becomes effective on April 1, 2016.

The RTCR is a federal rule and will become effective in Michigan on April 1, 2016, even if the Act 399 revisions have not been promulgated. On the effective date, regardless of the status of the Act 399 revisions, the LHDs will be required to assess compliance with the RTCR requirements at all noncommunity water supplies in Michigan.

Michigan and Wisconsin have the largest inventory of noncommunity water supplies of all of the states in the country, at over 9,500 each. Based on information gathered from a number of LHDs, additional resources will be needed for the LHDs to implement the RTCR. However, additional funding has not been identified. Nevertheless, the DEQ commits to explore and pursue any and all opportunities to obtain additional funding to provide to the LHDs for RTCR implementation.

The DEQ commits to continue working collaboratively with the LHDs to create and apply new procedures and tools to efficiently implement the RTCR. To assist with the resource demands of the RTCR, both the DEQ and the USEPA have prioritized the development and release of software that will allow laboratories to automatically upload sample analysis data. Recently, the DEQ clarified the definition of a seasonal system, and this reduced the number of seasonal systems from what was first anticipated years ago. The DEQ has developed a boilerplate-approved start-up procedure and certification statement that seasonal systems may use, eliminating the need for LHDs to approve specific start-up procedures for each seasonal system and review certification statements that could have been submitted in a variety of ways.

Cross connection control rules

Comments on the proposed cross connection rules were generally favorable, with exception. In response to comments received on the Cross Connections provisions, the proposed rules are changed as follows:

- Page 106, R 325.11401, change "public" to "potable" in the definition of "backflow" and add a definition for "unprotected cross connection." Matthew Kapcia's February 18, 2015 comments 3 and 5 suggested changes are included in the final rule.

- Page 106, R 325.11402(a), clarify the referenced codes. Matthew Kapcia's February 18, 2015 comment 6 and Kevin Roby's comment 1 recommended R 325.11402(a) be modified to include all applicable sections of the Plumbing and Residential Codes and to clarify when those or other codes need to be followed or applied. There seems to be some confusion about the intent of R 325.11402(a). The intent is not to require cross connection inspectors to enforce the Plumbing Code or require facilities to bring their entire plumbing systems up to date with current codes, rather it is a reminder that in some situations other rules or codes may be applicable. As an example, if new piping or a backflow preventer has to be installed to eliminate an unprotected cross connection, it has to be installed in accordance with appropriate sections of the Plumbing or Residential Codes. The wording in R 325.11402(a) has been changed to clarify this issue.

- Page 106, R 325.11403, Matthew Kapcia's February 18, 2015 comment 7 states that, as written, R 325.11403(2) could be interpreted that all facilities would have to be "contained" and that "isolation" is not allowed. Mr. Kapcia also suggested that for clarification purposes R 325.11403(1) be rewritten and 325.11403(2) be eliminated. The DEQ believes these rules are necessary and has modified them for clarification purposes. In addition, subrule (3) of this rule was added to further clarify what other types of water customers or piping configurations are also prohibited.

Comments on the proposed cross connection rules that are not being incorporated into the rule are the following:

- Page 4, R 325.10103, Matthew Kapcia's February 18, 2015 comment 4 suggested we change the definition of "cross connection." The DEQ believes the current definition is adequate and the change is not necessary.

- Page 107, R 325.11404(2)(d), Matthew Kapcia's February 18, 2015 comment 8, Michael Lueck's February 18 and 20, 2015 comments, and David Cardinal's comment suggested that the provision in this rule that allows backflow preventers installed on all lawn irrigation systems to be tested every five years was too infrequent and should be eliminated. Supporting documentation provided by the commenters included references to lawn irrigation systems being classified as high-hazard situations due to the potential of herbicides, pesticides, or other contaminants being drawn into the potable/public water supply during backflow conditions; the failure rates of backflow preventers increases significantly if the testing frequency is more than once every 3 years; allowing a different testing frequency for backflow preventers on lawn irrigation systems will cause confusion within the regulated community. The DEQ has decided to keep the 5-year provision in the rules due to the fact that, as written, this rule only allows the 5-year testing frequency for backflow preventers on lawn irrigation systems with no chemical treatment if it is specified within the local cross connection control program. This allows community water supplies some

flexibility to set the testing of backflow preventers on lawn irrigation systems based on specific conditions within their community. This is different from House Bill 5317 that was vetoed by the Governor since this rule allows the testing to be every 5 years, where HB 5317 stated that the testing could not be more often than once every 5 years.

- Page 108, R 325.11405(2), Matthew Kapcia's February 18, 2015 comment 9a suggested we change the word "active" to "current" as it pertains to the ASSE 5110 certification. The DEQ feels this change is not necessary and, therefore, did not include this suggested change in the final rule.

- Page 108, R 325.11405(2) Matthew Kapcia's February 18, 2015 comment 9d (as further supported in his February 25, 2015 comment) and David Cardinal's comment 2 suggested we add language to require water supplies to only accept test results of backflow preventers from individuals that hold an active ASSE 5110 certification but are also "licensed plumbers working for a licensed plumbing contractor as required by the State Plumbing Act". Joe Madziar, Chief, Plumbing Division, Department of Licensing and Regulatory Affairs, has gone on the record (July 21, 2014, Memorandum) stating that ASSE 5110 certified testers are not required to be licensed plumbers to test backflow preventers in Michigan. Therefore, the DEQ does not plan to include these suggestions into the final rule.

- Mike Kortman commented that all rules or provisions requiring cross connection control inspections and testing of backflow preventers at residential accounts be removed from the rules. The DEQ, public health and water supply officials have long been concerned about cross connections and interconnections in both residential plumbing systems and public water supplies. Since it was promulgated in 1976, Act 399 has stated that all cross connections, regardless of where they are located, are prohibited. This includes cross connection at residential accounts. While difficult to detect, there have been documented case histories of cross connections that resulted in backflow of contaminants and pollutants into the public water supply from residential accounts. The probability of a single plumbing system contaminating the public water system through cross connections may seem remote, but when an untold number of similar plumbing systems are considered, the probability increases. The only acceptable protection is to eliminate or protect all possible links whereby such pollution or contamination of the water system may occur, including those at residential accounts. In addition, the same person raised other questions or concerns about cross connection control requirements at residential accounts, which are included along with the DEQ's responses on the attachment to this JCAR Report.

- Kevin Roby's comment 2 stated he was unclear of the intent of the DEQ's Best Practices Manual for Cross Connection Control referenced in R 325.10113 on page 9 and R 325.11404 on page 107. The purpose of this manual is to

supplement the Part 14 Rules and to assist the water officials in the implementation of their cross connection control program. The manual was prepared to provide general guidance regarding cross connection control and backflow prevention and is intended to be used in conjunction with other references, like the Plumbing and Residential Codes. All new construction and modifications of existing plumbing should be inspected for compliance with the Plumbing Code.

Miscellaneous

- Page 9, R 325.10112, changed table from double spaced (improper for state rules) to single spaced.
- Page 9, R 325.10113(c), deleted "water bureau" in the Suggested Practices organization reference. The bureau no longer exists.
- Page 9, R 325.10113(d), and page 107, R 325.11404(1), changed the title of the manual that water supplies may use when developing a cross connection control program - from "Cross Connection Rules Manual" to "Best Practices Manual for Cross Connection Control."
- Pages 15-20, R 325.10401a, Table 1, changed from double spaced (improper for state rules) to single spaced.
- Pages 27-38, R 325.10405, Table 1, changed from double spaced (improper for state rules) to single spaced.
- Page 58, R 325.10704b(1)(d), subscripted numbers in notation for sodium thiosulfate from Na2S2O3 to $Na_2S_2O_3$.

(ORR-JCAR March 2014)

Additional Comments and Responses Pertaining to the Part 14 Cross Connection Rules

Comment 1: Why hasn't a standard for residential testing already been established after almost 40 years since Act 399 became law? There has been plenty of time and opportunity for a significant record of data to be compiled with thousands of connections being added every year.

DEQ Response: A frequency for testing assemblies was first established in the 2nd edition of the Cross Connection Rules Manual in 1988 and was adjusted in the 4th edition in 2008. Because there is no hydraulic difference between customer types, the frequency applies to all types. The DEQ now proposes to formally adopt those frequencies in our administrative rules.

Comment 2: Richard Benzie, then Chief of the Community Drinking Water Unit, testified before the House Regulatory Reform Committee on May 14, 2014. When asked by a member of the committee, he was unable to site a single instance of harm resulting from the lack of backflow testing in a residential setting.

DEQ Response: The EPA, American Water Works Association, American Backflow Prevention Association, and other organizations have published documented cases of contamination from backflow, including those from residential accounts. It is estimated that most, if not all, cases of backflow go unreported. One documented case occurred in Southgate, Michigan, where parasitical worms were sucked into the potable water supply of two homes via a lawn irrigation system. The Water Research Foundation has researched the vulnerability and occurrence of residential backflow. Based on their research using meters that measured any “negative” flow, they concluded that approximately 1.5 percent of residential customers experience some amount of backflow each month, with a total of 5 percent of the customers experiencing backflow annually. This further illustrates the need for proper cross connection control at residential accounts.

Comment 3: Even if the Department can provide specific data of backflow preventer failure rates, can those failures be tied to any instances of harm to drinking water customers? On the other hand, can it be shown that improved water quality is the direct result of increased testing?

DEQ Response: We know that certain hydraulic conditions will result in backflow and that certain fluids that could backflow into the potable system could cause illness or death. Since all mechanical devices are subject to failure, testing of devices is the only way to ensure they will function should there be a backflow event. As the agency responsible for assuring drinking water is safe for the public, it is the DEQ’s duty to require mechanical assemblies designed to prevent backflow to be tested.

Comment 4: To draw a comparison, note that speed limits are determined by traffic

studies and statistics. If a stretch of road has a history of violations and accidents, a restricted speed is justified. However, if no evidence of danger can be found, it is reasonable for the limit to be reconsidered and made less restrictive.

DEQ Response: Car accidents and violations are clearly visible and easily documented. Backflow is very difficult to document, and contaminated water in the distribution system is difficult to detect. In addition, since installation and testing have been required for decades, it can be inferred that this directly contributes to a low incidence of documented backflow events.

Comment 5: The proposed testing frequency is an arbitrary number. It has changed multiple times throughout the course of this process. A recently vetoed HB 5317 dealt with a residential backflow testing frequency. The frequency changed as the bill was drafted, as it passed the House, and again as it passed the Senate. The industry has not, and will not, provide an objective figure until an honest evaluation of actual conditions occurs.

DEQ Response: The proposed testing frequency is not an arbitrary number; it is based on overwhelming data provided by public water supplies and certified testers that clearly indicate failure rates increase as the time period between tests increases. As an example, pressure vacuum breakers (PVBs) tested yearly generally fail about 10 percent of the time and 20-30 percent of the time if tested every 3 years or more. Recently, a community water supply started requiring PVBs on residential lawn irrigation systems to be tested. Most of these PVBs had been tested at the time of installation, but not since. The results indicate that the average failure rate was 65 percent, which supports the need for frequent testing.

Comment 6: This rule change creates a discrepancy with the Michigan Plumbing Code, which states that all backflow preventers must be tested annually. Wouldn't time be better spent on resolving the differences between Department roles instead of relying on a Memorandum of Understanding from 2001 for enforcement?

DEQ Response: It would certainly have been simpler for the DEQ to adopt the annual testing frequency listed in the Plumbing Code. However, the DEQ decided to allow community water supplies to require testing of backflow preventers at a time interval stated in locally-approved programs, not as required by the Plumbing Code. The intent of the Memorandum of Understanding (MOU) was to clarify this position and has not been, nor is it ever intended to be, used as an enforcement tool.

Comment 7: These rule changes will have financial impact on small business owners, Community Water Supplies, and residential customers. This impact is not accurately reflected in the RIS for this draft rules package.

DEQ Response: These rules changes do not impose any new or additional requirements, other than the requirement to have backflow preventer testers be ASSE certified. Water suppliers, residential customers, and a majority of business

owners should not see a financial impact if they have been performing the proper cross connection control activities in the past. In the context of lawn irrigation systems, the financial impact decreases. Traditionally, the testing frequency has been 3 years while the proposed rules allow 5 years for irrigation systems.

With regard to the cost to public water supplies, they have been required to have a formal program of inspecting customers and testing backflow preventers since the inception of these rules in the 1970s. The rule changes only clarify and formalize the requirements. Utilities that have not been meeting the requirements up to this point have been saving costs.

Comments Continue: Please consider these points as red flags, signaling the need to reconsider the current draft language. Recommendation W-17 stumbles over the elephant in the room of an industry shored up by regulation. The recommendation seeks a proportional response to the actual threat. Arguments based on emotion and slim possibilities have been too common, while evidence of a problem is not. This should not be tolerated any longer.

To truly streamline and improve the cross connection landscape long-term, consider focusing these Part 14 requirements on Commercial and Industrial water customers, where they have historically been effective. This has been acceptable to the DEQ for many years. Residential issues will continue to be dealt with on a case by case basis by each community water supply, as they determine necessary. A distinction can be made between public buildings, where a higher level of protection can be justified, versus a private residence, where homeowners should maintain responsibility for the condition of their own plumbing system. This is no different than subjecting public buildings to fire safety requirements, while at the same time leaving a homeowner responsible to change the batteries in their own smoke detectors.

DEQ Response: This is also flawed logic. If a homeowner does not replace the batteries in their smoke detector, they risk having a fire destroying only their home. A homeowner with a lawn irrigation system has the potential to contaminate a public water supply distribution system; therefore, jeopardizing the public health of their family, neighbors, and the entire community.

Comments End With: Similarly, commercial vehicles and drivers must meet a higher standard on our roads; whereas, the majority of us are held responsible for the upkeep and safety of our own cars. Thinking like minded in terms of cross connection control will ultimately lead to a much more reasonable and proportional response, while respecting the privacy of residential water customers.

Subject: Region 5 Final Comments on MI draft RTCR for Public Hearing
Attachments: Comments final on Michigan draft RTCR Feb 2015.docx

Hi, Jean. Please see the attached comments on the Michigan draft RTCR. This list of comments includes my comments from Ground Water and Drinking Water Branch, and comments from Office of Regional Counsel. Please let me know if you have any questions.

It's been great working with you, Jean, as usual!

Jennifer

Final Comments on Michigan draft RTCR – February 18, 2015

Fed'l Cite	State Cite	Comment
141.2	108(c)	The draft rules use the term "seasonal supply" instead of "seasonal system", as noted in #29 of "Notes for Crosswalks". This is acceptable because the state consistently uses "supply" when referring to the regulated entity. However, the State rule defines "seasonal supply" using the terms "noncommunity water system" and "public water system." Did you intend to use terms "noncommunity water supply" and "public water supply?", page 7 of draft rule
141.74(c)(3)(i)	720(4)	Reference to "709d to 709h" should read "704d to 704h", page 113 of draft rule
		Also, why did the State leave out the phrase, "…as specified in paragraph (a)(1) of this section"…"
141.132(c)(1)(i)	719e(3)(a)	Reference to "709d to 709h" should read "704d to 704h", page 104 of draft rule
141.153(h)(7)(iv)	413(12)(g)(iv)	Reference to "paragraph (d)(4)" should read "paragraph (8)(d)". See page 63 of draft rule.
141.203(b)(2)	(403)(2)(b)	In the 3rd sentence, "MCL" is supposed to match up with "total coliform provisions under R 325.10602". Rule 602 just gives MCLs; where the Federal rule references the Total Coliform Rule. Should the State cite be Rules 705 to 709 for Total Coliform Rule? See page 27 of draft rule.
141.153(h)(7)(i)(A)	413(12)(g)(i)(A)	On page 32 of draft rule in Table 1, Health Effects Language for Total coliform bacteria beginning April 1, 2016, the State says,"Use language in R 325.10413(12)(g)(i)(A)". Why doesn't the State just insert the language here, as is done with other entries in Table 1?
Appendix B to Subpart Q	Table 1	The following lines of Table 1 are missing from the draft rule: **1.e**. Subpart Y Coliform Assessment and/or Corrective Action Violations, beginning April 1, 2016; **1.f.** Subpart Y E.coli Assessment and/or Corrective Action Violations, beginning April 1, 2016; **1.h**. Subpart Y Seasonal System TT Violations, beginning April 1, 2016.
Appendix B to Subpart Q	Table 1	On page 33 of the draft State rule; E.coli, beginning April 1, 2016; third line add "all required" after "take" and before "repeat".
141.853(a)(6)	704c(1)(f)	Second line, "paragraphs" should be "paragraph". Page 77 of State draft rule.
		Reference in second line, "(a)(5)((i)" should be (iii). Page 77 of State draft rule.

141.853(c)(1)(ii)	704c(3)(a)(ii)	Reference in second line should read, "R 325.10704h(1).
141.853(c)(1)(ii) and (iii)	704c(3)(a)(ii) and (iii)	The instances when the State may invalidate a total coliform sample result are the same in the RTCR and the original 1989 TCR. In 2009, the State amended its TCR State rule to clarify these instances when the State may invalidate a result. However, it appears the State has not carried over these clarifications in its State TCR, into its RTCR 704c(3)(a)(ii) and (iii). Does the State intend to carry over the 2009 clarifications made to the State TCR into the State RTCR Rule 704c(3)(a)(ii) and (iii)?
141.854(a)(4)	704d(1)(d)	Reference to "(f)(4)" = "(6)(a)(iv)", not "(6)(d)", on page 78 of draft State rule.
		Reference to "(g)(2)" = "(7)(d)", not "(7)(b)", on page 78 of draft State rule.
		Reference to "subdivision (b)" should be "subdivision (6)".
141.854(f)	704d(6)(a)(v)	Add "total coliform rule" after "…monitoring has 1…" and before "….monitoring violation". This is listed twice, on page 46 and on page 47 of crosswalk.
141.854(i)(2)	704d(9)(b)	State omitted reference to paragraph (c). Section 141.854(c) also includes monitoring more frequently than annual and other provisions.
141.858(a)(3)	704h(1)(c)	For clarification, add "of repeat monitoring" after "…conduct 1 round.." and before "…but is not required…". See page 85 of draft State rule.
141.859(b)(4)(iv)	704i(2)(d)	Rule 704i(2)(d) doesn't state that the department will make a determination.
None	708	Does this rule mean that if the system collects a sample when they learn of the invalidation, then this would be a valid sample? Perhaps add a phrase "a sample is taken by the system when they learn of the invalidation", after "…until the following monitoring period", and before "or if the department collects a sample…"
Endnote 18	Table 1 State rule 401a	Under III. Public notification for variances and exemptions: Rule 302 and Rule 312 are both listed under Citations for each item; however Rule 302 actually corresponds with the first item and Rule 312 actually corresponds with the second item. For clarification, the State could delete the Rules not needed under the Citation column.

MDEQ PART 14 RULE CHANGE PROPOSALS - PUBLIC COMMENTS February 18, 2015

MATTHEW KAPCIA
Licensed Master Plumber, Licensed Plumbing Contractor,
ASSE Certified Backflow Instructor, Cross Connection Inspector, Michigan Backflow Prevention Association

---

1. There should be a differentiation between the phrases Public Water Supply, and a Public Water Supplier.
   These Rules are interchanging the words Supply and Supplier which are two different things.
2. There are misspelled words. Insert hyphens where required. I.e. Non-potable, re-inspection
3. The Definition of "Backflow" should replace the word "public" and insert "potable".
4. Change the definition for "Cross Connection". (Using the ASSE [American Society of Sanitary Engineering] Plumbing Dictionary) - A physical connection or arrangement between two otherwise separate (piping) systems, one of which contains potable water and the other water of questionable or unknown safety. .....
   Current Definition of Cross Connection - "a connection or arrangement of piping or appurtenances through which a backflow could occur."
5. Insert a definition for "Unprotected Cross Connection". (Using the ASSE Plumbing Dictionary) - A cross connection between a potable and non-potable system where inadequate methods are provided to prevent backflow.
6. **Rule 1402**: "A connection with a public water supply system shall comply with existing laws, ordinances, **codes,** and rules including:"
   [Some people have misinterpreted this rule to mean that everything has to be brought up to current codes so clarify that in this section of the rules.] See 1402a below.
   Rule 1402 (a): The paragraph should simply state:
   "All sections of the Michigan Plumbing Code or the Michigan Residential Code pertaining to backflow and cross connection control. The Codes allow for existing plumbing systems to stay as currently installed, providing they were installed properly according to the code in effect at the time of installation and they do not currently present a safety hazard.
   There are sections in the Codes other than 608 that deal with backflow.
   Michigan Plumbing Code Sections 102.2 & 102.3 allow existing installations.
7. **Rule 1403 (2)**: Clarify what constitutes a cross connection for these purposes. The way it reads, it may be interpreted that all facilities must have a containment assembly installed.
   Better yet, just delete the second statement and leave in the first statement to now read:
   "Any temporary or permanent Unprotected Cross-connection between a public water supply system and any source, piping, or system that may contain non-potable water or other substances is prohibited."
   This proposed statement covers both types of cross-connection programs;
   being Containment and Isolation type programs.
8. **Rule 1404 (d)**:
   a. Remove the sentence referencing testing every 5 years for irrigation systems.
   i. The Michigan Plumbing and Residential Codes already have a schedule for testing backflow assemblies which is "annually".
   ii. Irrigation systems are high hazard applications due to chemical and biological contamination present on all lawns.
   iii. My personal experience with testing residential Pressure Vacuum Breakers for the first time is a 65% average failure rate.
   iv. Using a very common vacuum breaker model as an example, the failure rates were:
   84% for Generation 1 & 2 models
   74% for Generation 3 models,
   40% for Generation 4 models,
   0% for Generation 5 models installed last year.
   v. This indicates a need for assembly testing.

9. **Rule 1405**:
   a. Change the word "active" in the rule to read "current" ASSE 5110 Certification as the words have slightly different meanings.
   b. This Rule creates confusion about which ASSE 5110 Certified Testers may actually test in the state of Michigan because it disregards the requirement in State Plumbing Act 733 that testers must be licensed plumbers.
   c. The ASSE 5110 standard is an international standard that is very loose in allowing for who can become certified that requires "5 years experience in plumbing or a related industry field" (whatever that means.) For example: The ICC Plumbing Code Commentary specifically states that 'irrigation systems are not considered plumbing systems", yet ASSE will allow irrigation people to test. ASSE will also allow individuals illegally engaged in plumbing work without a license to test because they have experience working on plumbing, which only rewards these individuals for their criminal activities.
   d. Proposed Alternate Draft - "**(2) Beginning January 1, 2018, backflow preventer test reports may only be accepted if testing was performed by licensed plumbers that have a current ASSE 5110 tester certification, and are working for licensed plumbing contractors.**"
   e. The State of Michigan currently maintains control of the testers because State Plumbing Act 733 gives the state control over licensed plumbers.
   f. If unlicensed individuals are allowed to test, then **the State of Michigan will have no control over any of the testers** because the ASSE 5110 Tester Certifications are administered through an outside agency (ASSE) that is not under the control of the state.
   g. The ASSE 5110 Certification Standard only has provisions for certifying a tester. ASSE has little if any control over the testers after certification as there is no legal standard in place to suspend, de-certify, or otherwise sanction any certified tester.
   h. State Plumbing Act 733 regulates the installation and maintenance of plumbing.
   i. State Plumbing Act 733 states that all backflow preventers are a part of the plumbing system.
   j. State Plumbing Act 733 states that "a person shall not engage in or work at the business of a plumbing contractor… unless licensed".
   k. State Plumbing Act 733 states that "plumbing shall be performed by a licensed master or journey plumber."
   l. State Plumbing Act 733 states that a license is not required for certain work, and lists specific exceptions. … Backflow testing is not listed as one of the exceptions.
   m. State Plumbing Act 733 regulates the "maintenance" of plumbing, and Backflow Assembly Testing is a part of maintaining plumbing systems as required by the codes.
   n. State Plumbing Act 733 states that "**A licensed master plumber shall be in charge and responsible for** proper installation and **conformance with the code."**
   o. The requirement to test assemblies is in the Michigan Plumbing and Residential Codes, and plumbers are responsible for conforming to the codes.
   p. Unlicensed individuals are currently engaging in illegally repairing and installing backflow preventers on a widespread basis. Allowing these individuals to legally test would only allow them even greater access to conduct their ongoing criminal activities.
   q. I am not certain of the legal liability that this would place on the State.
   r. Unlicensed individuals and companies are not insured for illegally working on plumbing systems. Therefore, should a backflow incident occur resulting in sickness, loss of life, or physical damage, insurance companies may not pay off, resulting in further economic hardship to the customers.
   s. Attached are excerpts from State Plumbing Act 733.

State Plumbing Act 733 selected excerpts

[bold and underlined portions are not in the original text and are for emphasis only]

AN ACT to regulate the **installation**, alteration, **maintenance**, improvement, and inspection **of plumbing**; to provide certain powers and duties for certain state agencies and departments; to create a plumbing board; **to** define plumbing, plumbing contractors, and the classification of plumbers and to set standards for those classifications; **to provide for the licensing and regulation of classes of plumbers and plumbing contractors;**

338.3517 Definitions; J to M.

(e) "Minor repair" means a repair which involves only the clearance of stoppages, repair, or replacement of a faucet, valve, reinstallation of that same plumbing fixture provided that no modifications are made to the plumbing system, or residential domestic water treatment and filtering equipment. **Minor repair does not include any of the following:**

(*i*) **The repair or replacement of a backflow preventer** and air admittance valves.

(*ii*) A repair or replacement that is only a part of a larger or major renovation or repair.

338.3519 Definitions; P.

Sec. 9. As used in this act:

(a) "Person" means an individual, sole proprietor, partnership, association, corporation, governmental subdivision, public or private school, or public or private organization.

(b) **"Plumbing" means the practice, materials**, and fixtures, **in or adjacent to a building, structure, or premises, used in the installation, maintenance**, extension, or alteration **of all** piping, fixtures, plumbing appliances, **plumbing appurtenances, as defined by the code, in connection with** the sanitary drainage or storm drainage facilities, plumbing venting systems, medical gas systems, **backflow preventers**, and public or private water supply systems.

(c) "Plumbing contractor" means a licensed master plumber or a person who employs a licensed master plumber full-time to directly supervise the installation of plumbing as his or her representative engaged in the business of plumbing for a fixed sum, price, fee percentage, valuable consideration, or other compensation and who is licensed as a plumbing contractor.

MATTHEW KAPCIA

ASSE Certified Backflow Instructor, Cross Connection Inspector, Michigan Backflow Prevention Association

---

338.3525 Plumbing; license required; exceptions.

Sec. 15. (1) **A person shall not engage in or work at the business of a plumbing contractor**, master plumber, journey plumber, or apprentice plumber **unless licensed** or registered by the department. Except as provided in subsections (2), (3), (4), and (5), **plumbing shall be performed by a licensed master or journey plumber. A licensed master plumber shall be in charge and responsible for proper installation and conformance with the code.** Plumbing shall not be performed unless the plumbing contractor who is responsible has secured a permit from the state or a governmental subdivision authorized to issue permits.

(2) A license is not required for the following work:

(a) **Minor repair work**. **[SEE DEFINITION ABOVE]**

(b) The installation of a building sewer or water service pipe provided that a permit is secured from the responsible enforcing agency and inspections are performed. The installations shall comply with the applicable code.

(c) The installation of domestic water treatment and filtering equipment that requires modification to an existing cold water distribution supply and associated waste piping in buildings if a permit is secured, required inspections performed, and the installation complies with the applicable code. If the enforcing agency determines a violation exists, it shall be corrected by the responsible installer.

(3) A homeowner may install his or her own plumbing, building sewer, or private sewer in his or her single-family dwelling if a permit is secured.

(4) The installation of medical gas piping providing the installation shall be performed under the supervision of a licensed plumbing contractor.

(5) This act does not prevent a person from performing any activities within the scope of licensure or registration under any other licensure or registration act or applicable codes for that licensed or registered professional adopted pursuant to law.

Lansing, Michigan 48933

Proposed Administrative Rules
Promulgated Pursuant to Section 5
Of the Safe Drinking Water Act, 1976 PA 399, as amended (Act 399)

Comments for the record Act 399, Part 14 Rule Changes

Kevin Roby
City of Novi
kroby@cityofnovi.org
Water & Sewer Division

1. **Comment:**

   R 325.11402 Compliance with regulations and local codes
   Rule 1402

   Page 164, Rule 1402 (a) specifically addresses "Section 608, protection of potable water supply, of the Michigan Plumbing Code" and does not include Chapter 14 Referenced Standards of the Michigan Plumbing Code which addresses the standards (ASSE and CSA) inserted into Rule change 1405.

   Rule 1402 (a) does not include "Section P2902, protection of potable water supply or Chapter 44 Referenced Standards" noting that single and multi-family residential is specifically called out in Rule change 1403(2).

   From a water supplier interpretation and inspection standpoint, the intent and spirit of these rule changes are really unclear to me. If the intent and spirit of these rule changes is to require that protection of the public water supply be protected through the Michigan construction codes then I offer the following language changes;

   Rule 1402. A connection with a public water supply system shall comply with existing laws, ordinances, codes, and rules including:

(a) The Michigan Plumbing Code and the Michigan Residential Code

This would cover all plumbing systems including residential. Any provisions of these codes that you wish to exclude could be covered and listed in the best practices manual.

Rule change 1402 specifically inserts **"codes"** as part of the rule change.

Section 109.1 of the Michigan Plumbing Code provides for a means of appeal. Section 105.1 of the Michigan Plumbing Code provides the authority to the Code Official to grant "modifications" to the code under certain conditions when there are practical difficulties carrying out the provisions of the code.

Section R112.1 of the Michigan Residential Code provides for a means of appeal.
Section 104.10 of the Michigan Residential Code provides the authority to the Code Official to grant "modifications" to the code under certain conditions when there are practical difficulties carrying out the provisions of the code.

Given that Rule change 1402 (a)(b) includes construction codes, do these sections for appeal and/or modifications apply as a means of appeal after the issuance of a certificate of occupancy?

2. **Comment:**

Page 165, Rule change 1404 (1) "Supplies may use the cross connection best practices manual prepared by the department, office of drinking water and municipal assistance, listed in R 323.10113"

The intent and spirit of the "Best Practices Manual" is unclear to me? Is this manual intended to be a set of regulations that a water supplier uses as set of regulations/requirements/codes to be followed through the history of the building during its inspection frequencies? If we find a violation after the building is constructed under the Michigan Plumbing Codes and Michigan Residential Codes, what set of inspection and abatement requirements does an inspector follow, the construction codes or the best practices manual or both? If there is a conflict between the construction codes and the best practices manual, which does the water supplier follow for abatement of violations?

3. **Comment:**

Page 165, Rule change 1404. (D)"Backflow preventers installed on lawn irrigation systems with no chemical treatment may be tested once every 5 years if specified within the cross connection control program"

Does this Rule change include ALL lawn irrigation devices or just single family residential?

4. **Comment:**

Page 165, Rule change 1405. (1) Backflow preventers shall meet the applicable ASSE or CSA Standards.

Rule change 1402. (a); specifically states that compliance with Section 608 of the Michigan Plumbing is required. Section 608 of the Michigan Plumbing Code includes other standards in addition to ASSE and CSA. Is this section amending Section 608 of the Michigan Plumbing Code? The same would also be true for the Michigan Residential Code Chapter 29.

Should Rule change 1405. (1) Also include the requirement of compliance with the manufacture specifications and installation instructions?

Subject: FW: Flint WTP CT
Attachments: FlintCTcalculator.xls

Steve spreadsheet is correct. If you open it up and in the flow rate box insert 18 mgd rather than 36, you'll notice the log inactivation achieved is 0.46, which is what Mike came up with this morning when he used 18 mgd. This is not a %, it's a log number. They need 0.5 logs but are getting 0.46, that's 92% of what they need.

Subject: RE: Flint WTP CT

They seem to meet the extra 0.5 log removal with no problem (see attached) at 0.25 intermediate Cl, 1.0 PT Cl and 9 pH.

Also they will not be producing 36 MGD during the interim period so the flow rate can be significantly reduced.

To: Cook, Pat (DEQ); Busch, Stephen (DEQ)
Subject: Flint WTP CT

Attached is the Flint WTP CT calculation for several different operating scenarios with worst case meaning cold water – 0.5 deg C.

1. 12 MGD (0.5 C, pH 7.5, final CL 1.0 ppm)
2. 18 MGD (0.5 C, pH 7.5, final CL2 1.5 ppm)
3. 18 MGD w. softening (0.5 C, pH, final CL2 2.5 ppm)

Based on the higher pH, a minimum free residual of 2.5 mg/l from the clearwell appears necessary to meet the required CT in the third scenario.

I also ran the CT calc for the 3 MGAL clearwell at 2 deg C using the regression method. I will place a hard copy of the calc on your desk since my computer not mapped to the scanner on the printer….

Michael Prysby, P.E.
District Engineer
Office of Drinking Water and Municipal Assistance
517 290-8817

Instructions for using this C*T Calculator:

1.) Gather data for the water supply. Data of concern is the maximum pH value and the minimum chlorine residual for each monitoring location within the plant. The sheets here allow the last 2 years worth of data to be entered, as well as an "other value".

*The "other value" can be useful if there is a historic minumim or maximum value that you would like to use, or to determine the minimum residual that needs to be maintained in order to satisfy the C*T requirement.*

*The data contained in these sheets is transferred to a "Water Quality Report" sheet that will print out with the C*T calculation when the "Print Report" button is clicked.*

2.) Be sure to label each monitoring location on the two data sheets. The label allows you to associate a monitoring location with each process on the CT Calculator sheet.

3.) Determine the number of processes that will be used in the C*T calculation. Then, on the CT Calculator worksheet, click the "Add Process" button until the appropriate number of processes are shown. The add and remove [Add Process] always perform their operations on the second column.

4.) Title each process and fill in **ALL** of the yellow cells for each process. Make sure that the monitoring locations on the CT Calculator sheet match the appropriate monitoring location specified on the pH and Cl sheets. Also determine the log inactivation required through disinfection and fill in the cell on the left side to reflect the requirement.

5.) Once all of the pH and chlorine residual data is entered and all of the yellow cells are filled in on the CT Calculator sheet, you are ready to make the CT calculation. Click on the "Calculate C*T" button. The rest of the empty cells should fill in and provide you with a percentage of t[Calculate C*T]equirement. If the requirement is above 100%, then C*T has been attained.

6.) Before printing the report, fill in the text boxes on the "CT Calculator" sheet to reflect the plant evaluated, the purpose of the evaluation, and the assumptions made during the calculation.

7.) When you are ready to print, click the "Print Report" button. Three pages will print: The C*T calculation, the Water Quality Report, and the Chlorine Residual Graph. You can still print a single sheet if you wish by selecting print from the file menu. [Print Report]

Other Instructions:

This button will clear the blue cells, which are filled in by the macro when the "Calculate C*T" button is pressed.

[Reset Macro]

[Calculate C*T]

This button will clear all of the cells on the "CT Calculator" sheet and remove all but one process.
You will lose any data you had previously entered

[Reset Sheet]

Water Treatment Plant

Sanitary Survey 2005

Assumptions:

Cell: A4
Comment: DEHTIARL:
The minimum working level should determine the volume of each process.

Cell: A5
Comment: DEHTIARL:
The flowrate should be entered as the flow through the basin or process at the rated plant capacity.

Cell: A9
Comment: DEHTIARL:
Refer to EPA's LT1ESWTR Disinfection Profiling and Benchmarking Guidance Manual found at the following link:

http://www.epa.gov/safewater/mdbp/pdf/profile/lt1profiling.pdf

Cell: A10
Comment: DEHTIARL:
This must match one of the monitoring locations found on the Cl sheet.

The closest free Cl monitoring site downstream of each process should be used.

Cell: A13
Comment: DEHTIARL:
This must match one of the monitoring locations found on the pH sheet.

The closest pH monitoring site upstream of each process should be used.
(Assuming pH values decrease through treatment)

Good morning Anita,
Please review the attached customer email and respond at your earliest convenience or if another staff member is a more appropriate responder, then please forward.
Thank you for your continued assistance.
I greatly appreciate your support.

Tonya

YourMessage: Hello, My mother and I are residents of City of Flint and there is a problem with the drinking water. It routinely smells like the sewer line has crossed into it, is colored instead of clear, and no longer smells like it has any chlorine in it at all. The city has had a problem with moving the water and issued three boil water advisories in 30 days. We did not find out about them because the announcement only went on the news instead of in an automated message and we don't have cable, so we don't generally watch TV. I am extremely concerned that the water is not clean when it actually reaches my home, irrespective of how clean it is when it leave the factory and I am not sure why this would be, since this was never a problem when the water was supplied by Detroit; it never smelled like the sewer and I could always smell the chlorine. Please advise.

EXECUTIVE SUMMARY

Environmental Protection Agency (EPA) and Michigan Department of Environmental Quality (MDEQ) regulations require that public water suppliers test drinking water quarterly throughout the distribution system for disinfectant by-products (DBP's). Two categories of DBP's, tri-halomethanes (THM) and halo-acetic acids (HAA5), are regulated and must be tested for. The City of Flint began operation of their water treatment plant (WTP) full time with the Flint River as the source on April 25, 2014. Since that time, two quarters of samples taken indicate that future violations are inevitable for total THM without some modifications to the water system. In response, the City hired Lockwood, Andrews & Newnam, Inc. (LAN) to complete this Operational Evaluation Report (OER) in conformance with EPA guidelines with the goal to determine the cause(s) of high levels of THM and evaluate possible solutions.

The EPA promulgated the Stage 2 Disinfectants and Disinfection By-Products Rule (DBPR) in January 2006 which set maximum contaminant levels (MCLs) for total trihalomethanes (TTHM) and HAA5 based on an annual running average, tested quarterly, for a given sampling location. The City of Flint reports levels from 8 sampling test locations. Of the two quarterly sampling cycles since Flint began operating the WTP full time, HAA5 levels have been acceptable but TTHM levels have been high at all 8 sampling sites.

According to the Stage 2 DBPR, the annual average value requires 3 quarters of sampling data with the most current period counting twice. Therefore, the City of Flint has not yet experienced a violation of the TTHM MCL because only 2 quarters of data have been obtained. However, levels recorded indicate the likelihood of an MCL exceedance later this year.

A number of issues have been identified as possibly contributing to the high THM levels measured.

1. Inefficient ozone system functionality which has resulted in increased chlorine feed.
2. Upstream influences in terms of increased chlorine demand.
3. Bypass stream around softening contributed to chlorine demand.
4. Unlined cast iron pipes in the distribution system contributing to chlorine demand.
5. Recirculating water in the distribution system due to less than ideal configuration of Cedar Street and West Side pump stations.
6. Broken valves resulting in stagnant water in some areas.
7. High chlorine demand in filters.
8. High THM formation potential (THMFP) in source water.
9. Less than optimal removal of THM precursors

ACTION PLAN

The City of Flint has signed an agreement with the Karegnondi Water Authority (KWA) to purchase raw water drawn from Lake Huron. The KWA system is currently under construction and expected to be operational by late 2016. The water supply from Lake Huron will have entirely different water quality characteristics from the Flint River and those characteristics are expected to yield drastically reduced DPB formation. With that, non-structural options to help reduce THM levels are much preferred over solutions requiring new construction. Therefore, two categories of actions have been devised: Stage 1 being actions that can be completed relatively quickly without major construction and Stage 2 consisting of either long term actions or solutions requiring major construction. The City has completed or intends to complete Stage 1 Actions by February 16, 2015, the week in which the next quarterly sampling is to be done. Stage 2 actions are to be implemented only if Stage 1

actions are ineffective in adequately reducing TTHM levels and therefore Stage 2 is contingent upon the outcome of Stage 1.

Stage 1 – Immediate Actions

- Hire ozone system manufacturer to troubleshoot ozone system
- Bench scale jar testing
  - Match existing process and access possible areas of improvement
  - Simulate potential modifications to treatment process
  - Evaluate coagulation and flocculation polymer aid feeds to assist with TOC removal
- WTP operational changes
  - Discontinue softening bypass stream to reduce chlorine demand
  - Disinfection of filter beds to reduce chlorine demand
  - Possibly begin coagulation and flocculation polymer aid feeds to assist with TOC removal depending on bench scale test results
- Increase water main flushing efforts to minimize stagnant water
- Water system modeling to identify areas with high water age and potential solutions
  - Cedar Street Pump Station potential recirculation
  - West Side Pump Station potential recirculation
  - Storage tank volume use
  - Possible broken closed valve locations
  - Locations in need of flushing
  - Lower high water levels in storage tanks

Stage 2 – Contingent Actions

- Fix ozone system
- Start feeding coagulation and flocculation polymer aids to lower TOC, if not completed in Stage 1
- Convert to lime and soda ash softening
- Change disinfectant to chloramine or chlorine dioxide until KWA
- Install pre-oxidant feed at intake to optimize ozone disinfection
- Implement advanced treatment for THM precursor removal
- Increased main flushing based on water modeling results
- Continue valve replacements with water model assistance
- Emphasize cast iron pipes on water main replacement priority list

DRAFT

I. BACKGROUND

The City of Detroit Water and Sewer Department (DWSD) has historically provided drinking water for the City of Flint and Genesee County. In the late 1990's growing concern regarding the reliability of the DWSD supply prompted the City of Flint to upgrade their existing water treatment plant (WTP). Those improvements, defined as Phase I, were completed in 2005 and were intended to allow the Flint WTP to operate, using the Flint River as the source, for an extended period of time in the event that supply from the DWSD was temporarily interrupted. Additionally, the Phase I improvements set the stage for Flint to break free from dependence on the DWSD supply and water charges over which they had no control.

A. WATER SUPPLY TRANSITION

1. Detroit Water and Sewer Department (DWSD)

Until recently the Genesee County and Flint region had been provided drinking water by the DWSD. However, due to excessive cost increases and reliability issues with the DWSD system other options had to be explored.

2. Karegnondi Water Authority (KWA)

In 2010 the Karegnondi Water Authority (KWA) was formed for the purpose of developing a new water supply from Lake Huron to serve the region in lieu of the DWSD supply and the City of Flint elected to join. The KWA expects the new system which is currently being constructed to become operational in the fall of 2016.

3. Flint River – Interim Period

With a renewing water supply agreement between Flint and the DWSD being terminated by the DWSD (effective April 30, 2014) and the KWA system not expected to be operational until late 2016, the City of Flint decided to initiate operation of the existing WTP full time utilizing the Flint River as the interim water source. A variety of WTP improvements were necessary for the Flint plant to become a full time plant. For purposes of this report, Phase II improvements to the Flint WTP are improvements which have been made to allow the plant to operate full time with either the Flint River as the source or the KWA supply as the source.

B. TTHM PENDING VIOLATIONS

The calculation for determining if the MCL has been violated for TTHM is:

(2 x current quarter value + previous 2 quarter values) / 4

Flint has completed tests for 2 quarters and therefore has not violated an MCL limit to date. However, the third quarter of sample data is likely to provide MCL exceedances at all 8 sampling sites. Test results are tabulated below.

DRAFT

TABLE 1 – 2014 DBP TEST RESULTS						
Sample Location	TTHM			HAA5		
	1st Qrt 5/21/14	2nd Qrt 8/21/14	3rd Qrt	1st Qrt 5/21/14	2nd Qrt 8/21/14	3rd Qrt
1) 3719 Davison - McDonalds	162.4	145.3		64	43	
2) 822 S. Dort Hwy - BP Gas Sta.	111.6	112.0		52	40	
3) 3302 S. Dort Hwy – Liquor Pal.	96.5	127.2		48	31	
4) 3606 Corunna – Taco Bell	106.4	181.3		55	24	
5) 2501 Flushing – Univ. Market	75.1	196.2		38	17	
6) 3216 MLK – Salem Housing	82.2	112.4		41	25	
7) 5018 Clio – Rite Aid	88.2	144.4		49	30	
8) 6204 N. Saginaw – N. Flint Auto	79.2	118.3		50	37	

TTHM MCL = 80 ug/l
HAA5 MCL = 60 ug/l

C. WATER TREATMENT PLANT RECENT IMPROVEMENTS & STATUS

1. Phase I WTP Improvements

Since 1965, the Flint WTP has remained a secondary or backup supply system to the DWSD primary supply. Typically the secondary supply for a public water system is expected to be needed only during emergency situations and normally is designed for short term operation such as providing the average daily demand for a few days. Conversely, Phase I improvements were designed with the intent to upgrade the Flint WTP in order to allow for an extended short term period (6 weeks) because of the perceived high risk that the DWSD supply would fail and remain out of service for an extended duration. Regardless, the Flint WTP was still intended to serve as a standby plant and as such the Phase I improvements lacked redundancies that would be required for a primary supply WTP.

2. Past Pilot Study & Testing

During design of the Phase I improvements a treatability study was completed by Alvord, Burdick & Howson, LLC (AB&H) in 2002. The Treatability Study evaluated the current treatment processes that are in place at the Flint WTP today with the Flint River as the source. The report recommended the following:

TABLE 2 – 2002 WTP TREATMENT RECOMMENDATIONS			
Treatment	Purpose	Point of Application	Dosage (mg/l)
Sodium permanganate	Zebra mussel control	Intake	0.3
Ozone	Taste & odor removal, disinfection	Diffusor basin	1.5
Ferric chloride	Coagulation	Rapid mix	40
Coag aid polymer	Turbidity & TOC removal	Rapid mix	2.0
Floc aid polymer	Turbidity & TOC removal	Floc basin	0.05
Lime	Softening	Softening basin	175
Soda ash	Softening	Softening basin	52
Carbon dioxide	pH adjustment	Recarb basin	37
Media filters	Filtration	Na	Na
Chlorine	Disinfection	Filter effluent	1.0

Of the recommended items, zebra mussel control, coagulant and flocculation polymer aids, and soda ash feed have not been incorporated into the treatment process.

3. Phase II WTP Improvements for Full Time Operation

Phase II WTP improvements are those needed to convert the Flint WTP from a back-up supply to a primary supply plant. A number of improvements have already been constructed as they were necessary to operate full time, treating water from the Flint River. The improvements under the title of Phase II that have been completed or are nearly complete include upgrades to the lime sludge lagoon, the lime sludge lagoon decant and disposal system, decant pump station and force main, installation of mid-point chlorination before filtration, and upgrade of the electric feed sub-station.

Additional improvements to the Flint WTP that are to be completed to become part of the normal treatment process using water supplied by the KWA are:

- New oxygen and nitrogen storage facilities for the ozone system (under construction)
- New coagulant feed system
- Electrical
  - Pump Station #4 upgrades (under construction)
  - SCADA and controls upgrades
  - Filter transfer pump station feeders
- Installation of the future raw water feed connection point for the KWA (under construction)
- Pump replacements and VFD installation in the low and high service pump station (under construction)
- Filter transfer pump station to Dort Reservoir
- Facility security improvements

DRAFT

II. SOURCE WATER EVALUATION

A. DATA ANALYSIS

Based on past data collected and the 2002 Treatability Study by AB&H, the Flint River water quality varies seasonally with higher hardness and alkalinity experienced in the winter. Higher magnesium concentrations are also experienced in the winter, adding difficulty to the settling process due to neutrally buoyant floc. General water quality average characteristics recorded for the 2002 Treatability Study as compared with average characteristics recorded this year are shown in Table 3 below.

TABLE 3 – FLINT RIVER WATER QUALITY CHARACTERISTICS

Period	Turbidity NTU	TOC Mg/l	Alkalinity Mg/l	Hardness Mg/l as $CaCO_3$	pH	Total Col. Count/day
2001 Apr–Oct	7.9	9.4	215	272	8.1	870-1230 (7300 max)
2014 May–Oct	8.3	10.3 5/22/14	207	252	8.2	1900-9000 (48,300 max)

Other than total Coliform, the Flint River characteristics do not appear to have changed significantly over the past 10+ years. Note that further investigation by City staff revealed a sewer leak upstream of the plant that may have contributed to the total Coliform count. The leak was subsequently repaired.

B. CONCLUSIONS

Considering the minor changes in Flint River water quality, much of the information contained in the 2002 Treatability Study by AB&H remains relevant today. Data from that report assumed to be consistent today include the following:

- Flint River is influenced by groundwater from a dolomitic aquifer
- Hardness varies seasonally with higher hardness and alkalinity in the winter
- Hardness, alkalinity, magnesium concentrations tend to be reduced by run-off
- Total THMFP is likely 380-440 micrograms per liter as measured between April 2001 and January 2002. The City intends to re-test the raw water to confirm the THMFP has not changed. Results are pending.

In development of the 2002 Treatability Study, processes were simulated which resulted in low THMFP. Therefore, information contained in that report will be used to assist with establishing a baseline jar testing procedure as discussed further in Section III.

DRAFT

III. TREATMENT PROCESS EVALUATION

A. EXISTING PROCESS DESCRIPTION

The existing WTP consists of an intake with screening from the Flint River, low lift pumping, ozonation, rapid mix, flocculation, settling, softening, recarbonation, filtration, storage and high service pumping. A process diagram is shown as Figure 1.

1. Intake

A 72" diameter pipe draws water from the Flint River through 2 traveling screens to the low lift pump structure. No chemicals are currently fed for Zebra mussel control or pre-oxidation as recommended by the 2002 Treatability Study. Manual removal of zebra mussels proved to be more economical than installation of chemical feed equipment considering the short term need.

2. Ozone

There are 2 ozone generators designed to provide adequate ozone for a WTP flow of up to 36 mgd. There are 3 ozone contact basins. The ozone generators were designed to produce 900 lbs/day at 10% concentration and up to 1300 lbs/day at 6% concentration each. Recent readings have indicated a production rate of approximately 700 lbs/day at 4% concentration. While serving the purposes of taste and odor control and disinfection, it is possible the current ozone feed might not be optimized to realize additional TOC removal benefits demonstrated by previous tests. Also, less than optimal ozonation has led to increased chlorine feed.

3. Rapid Mix

East and West rapid mix chambers allow chemical feed prior to the flocculation basins. Each rapid mix chamber is equipped with a 5 hp mixer.

4. Coagulation / Flocculation

The WTP contains two equally sized flocculation basins, east and west, and each basin provides tapered or gradually slowed mixing from inlet to outlet. There are fifteen 2 hp mixers for each basin with VFDs to control mixing speed. The 2002 Treatability study recommended feeding both coagulation and flocculation polymer aids. Neither polymer aid is being used today because turbidity and TOC removals have been sufficient to meet regulatory requirements.

5. Settling

Primary clarification takes place within 3 basins containing plate settlers. The settlers are operating as designed.

6. Softening

Again, there are two basins for softening: east and west. Each basin is 120' in diameter and contains a solids contact softening unit. Each softening basin/unit has a design capacity of 18 mgd. Low lift pumping limitations, flow control to the basins, and fluctuating demands have made it difficult for WTP staff to stabilize the softening process. Softening is accomplished by feeding lime. The decision was made by the City not to feed soda ash in order to remove non-carbonate hardness because acceptable hardness levels could be achieved with lime feed only and softening is short term until Lake Huron water becomes available.

DRAFT

7. Recarbonation

Recarbonation for pH adjustment is accomplished in east and west recarbonation basins between and to the north of the softening basins. Carbon dioxide storage and feed equipment is located west of the recarbonation basins.

8. Filtration

Filtration is accomplished with 12 dual media filters, equally sized and designed to filter 3.0 mgd each. Media consists of 12″ of sand and 18″ of anthracite. The filters have been operated intermittently over the years due to the standby nature of the WTP and until recently, chlorine injection took place downstream of the filters. It is possible some microbial growth has developed in the filters.

9. Disinfection

Limited disinfection is provided by ozonation, but the primary form of disinfection is chlorine fed prior to filtration and prior to finish water storage / high service pumping. The intermediate chlorine injection location was recently constructed under the Phase II, Segment 1 contract.

10. Clear Well & Pumping

The pump building sits adjacent to a 3 MG clear well and contains both low and high service pumps.

B. JAR TESTS / EXPERIMENTS

1. Approach

There are several well practiced methods by which DBPs can be reduced. First, the disinfectant can be changed to an alternate that has a lower tendency to form DBPs. Second, additional treatment systems such as activated carbon or air stripping (depending on the nature of the precursors) can be added to remove DBP precursors. Lastly, the existing treatment processes can be optimized to remove as much DBP precursor as possible. Of these options, optimizing existing treatment processes is the only strategy that does not require the construction of new and expensive facilities. It is anticipated that Flint will be receiving Lake Huron water in approximately two years and this water will have a completely different chemistry from the Flint River. Major process changes instituted to address THM levels using Flint River water are likely to be unnecessary for Lake Huron water and may even be inappropriate. Therefore, those options which require addition of new treatment processes are undesirable at this time. In recognition of this upcoming change in water source, this study will concentrate on improving the existing processes, rather than adding new ones. New treatment processes will only be recommended if operational changes to the existing treatment train prove ineffective.

Recent sample test results suggest that most of the DBPs are formed in the distribution system rather than within the treatment plant. Therefore, the most logical approach is to reduce the DBP formation potential (DBPFP) rather than simply lowering the levels of DBPs leaving the plant. During bench scale testing, formation potential (FP) levels will be the primary indicator of success or failure of any proposed process modifications.

2. Protocol

Bench scale pilot testing is intended to reflect actual plant operating and hydraulic conditions so the bench scale treatment units will be sized based on various dimensionless factors to ensure the pilot treatment matches the actual system. Bench scale ozonation is not practical due to time and cost limitations. Therefore, water

DRAFT

samples will be withdrawn following the plant ozone basin. These samples will be transported to the laboratory where they will be dispensed into square testing jars. The jars will act as rapid mix, three-stage flocculation, and settling. Rapid mix and flocculation conditions will be matched to the plant based on "Gt" values. The "G" value is a measure of the mixing intensity and is a function of mix time, viscosity of the liquid, and mixing power applied to the water. "Gt" then, is a size scaling factor where time has been accounted for. Settling time will be scaled to match the shorter settling depth of the testing jars. After settling, samples will be decanted from the test jars. The decanted samples will then be lime softened; softening conditions will be similarly matched on the basis of "Gt". Fluoride will be added and carbon dioxide sparged into the samples to reduce the pH. The water will then be vacuum filtered through filter paper, sized to simulate the plant's dual media filters. The samples will be dosed with excess chlorine and allowed to react for seven days before testing for DBPs to determine the formation potential.

Although these conditions may be refined based on new information, we anticipate the following:

TABLE 4 – BENCH SCALE TEST MIXING INTENSITIES

Process	G	Duration
Ozonation	Plant	-
Rapid Mix	350	25 sec
Flocculation, Stage 1	50	9 min
Flocculation, Stage 1	25	9 min
Flocculation, Stage 1	12	9 min
Settling	na	10 min
Softening	JBD	10 min
Recarbonation	na	na

It is expected that the primary variables during the testing will be chemical additions and chemical dosages. Specific chemicals and dosages used for initial testing conditions will be selected to reflect current plant usage and the recommendations of the 2002 Treatability Study.

TABLE 5 – BENCH SCALE TEST CHEMICAL FEED RATES

Chemical	Current Usage	2002 Study
Ozonation	4.66 mg/l	1.5 mg/l
Ferric Chloride	7.7 mg/l	40 mg/l
Coagulant Aid Polymer	Not used	2.0 mg/l
Flocculation Aid Polymer	Not used	0.05 mg/l
Lime	120 mg/l	175 mg/l
Soda Ash	Not used	52 mg/l
Cationic Softening Polymer	3.13 mg/l	Not used
Anionic Softening Polymer	0.88 mg/l	Not used
Fluoride	0.45 mg/l	1 mg/l
Carbon Dioxide	32 mg/l	37 mg/l
Chlorine	6.3 mg/l	1 mg/l

3. Considerations

The 2002 Treatability Study did not note significant formation of DBPs. This may be a function of different Flint River water chemistry at that time. However, recognizing the considerable differences in chemical usage and dosages between that study and current operations, those differences in chemical use and dosage are an obvious starting point for optimizing treatment to prevent DBP limit exceedance.

Although it is believed that optimization of current treatment can correct the DBP issue, should optimization of present treatment prove insufficient, alternate residual disinfectants (chloramines and chlorine dioxide) will be investigated as additional treatment measures.

4. Results

[To be completed following jar testing and experimentation]

5. Conclusions

[To be completed following jar testing and experimentation]

DRAFT

IV. DISTRIBUTION SYSTEM EVALUATION

EPA guidance for the distribution evaluation portion of an OER is focused on identification and isolation of a specific portion of the distribution system that led to the exceedance. The circumstances of Flint's apparent pending TTHM exeedances are unusual in that a new supply has been implemented which clearly corresponds to the high TTHM sample results. Despite obvious implications to the primary cause of increased TTHM levels, value remains in evaluating the distribution system as there may still be distribution improvements that can be made to help alleviate the problem.

Evaluation of the distribution system, including modeling, was recently added to LAN's scope of services. When finished, information will be provided to complete the following topics in this section.

A. INFRASTRUCTURE

1. Piping

According to the most recent MDEQ Sanitary Survey, the distribution system is estimated to contain 70% cast iron, 20% ductile iron, 2% concrete and 8% steel water mains. Unlined cast iron pipe can become pitted, allowing colonization sites for microorganisms leading to chlorine demand. Additionally, much of the piping in the system is aged and in poor condition. Increased chlorine demand could be resulting from biofilm in older pipes and from main breaks/repairs.

The City utilizes City Point software and GPS equipment to document main breaks and prioritize replacements. Areas that have been targeted for main replacements include Fenton Road, Atherton Road, Dort Highway, Averil Street, and Boulevard Drive. The extent of contribution is not known but any water main replacement project will contribute to decreasing chlorine demand somewhat if constructed properly.

2. Storage

[To be completed]

- *Appropriate capacity*
- *Mixing, baffling, other provided to prevent stagnant water*
- *Condition*

3. Pump Stations

[To be completed]

- *Condition*
- *Pump capacity evaluation*
- *Valve condition and pressure zones*

B. OPERATIONS AND MAINTENANCE

1. Pump Station & Storage Operations

[To be completed]

- *Control of pressure districts*
- *WTP Pump Station (No. 4)*
- *Cedar Street Pump Station*
- *Westside Pump Station*

DRAFT

- *Torrey Road Pump Station*
- *High and low levels in tanks*

2. Booster Disinfection Practices

Booster disinfection is provided at the Cedar Street and Westside pump stations. Sodium hypochlorite is applied while the reservoirs are being filled.

3. Changes in System Demands

[To be competed]

- *Long term decline in demands*
- *Short term fluctuations – max day in winter due to high volume of main breaks*

C. WATER SYSTEM HYDRAULIC MODELING

[To be completed]

1. Simulation of Existing System

Match existing conditions, particularly chlorine residual. We have chlorine feed data at plant and residuals at 10 locations in each MOR, May-October.

2. Identification of Deficiencies

Specific issues to look at:

Worst case at minimum daily demands
Water age in entire system
Recirculating water through pump stations
Use of storage tanks
Indications of broken valves
Effectiveness of booster disinfection

DRAFT

V. RECOMMENDATIONS TO MINIMIZE FUTURE OEL EXCEEDANCES

A. SOURCE

The City of Flint has already committed to the change from the Flint River as the water source to Lake Huron under the KWA system, planned for late 2016. The risk of future TTHM limit violations will decline substantially with the use of water from Lake Huron due to much lower DBP precursors. It is important to recognize that the Flint River will become strictly an emergency supply when the KWA supply becomes available and any investments toward the Flint River should be contemplated accordingly. Recommendations discussed below in this section apply to the Flint River as the source.

Reverting to supply from the DWSD until the KWA supply is available as an option. However, the DWSD has stipulated that a $4 million connection fee would apply and current water rates would include approximately $900,000 / month flat fee plus usage charges. Therefore, utilizing the DWSD for interim supply is cost prohibitive under the terms defined by the DWSD.

1. Watershed Management

A volunteer group entitled the Watershed Coalition performs various tasks related to managing the Flint River watershed such as spring cleanups and annual benthic studies to evaluate the river 'health'. No additional action is recommended at this time.

2. Monitoring

The City documents typical raw water characteristics as part of standard preparation of Monthly Operating Reports (MOR). No changes are recommended at this time.

3. Intake Operations

The 2002 Treatability Study recommended pre-oxidation in the form of sodium permanganate as a feed at the intake. However, pre-oxidation with sodium permanganate is unlikely to provide significant oxidizing of organics beyond that provided by ozonation. It is possible the addition of hydrogen peroxide would enhance the ozone process.

4. Seasonal Strategies

Past data indicates the Flint River is influenced by groundwater and in particular, dolomitic spring water. The result is hard water with high concentrations of magnesium and sulfate. Also, hardness and alkalinity are higher during the winter. Upon initiation of supply from the Flint River, the City made the decision to soften with lime only to focus on removal of carbonate hardness. One potential modification that could assist with TOC removal and thus decrease THMFP would be lime and soda ash softening. If implemented soon, the procedural change would be timely as it would also address increased hardness expected going into this winter.

5. Upstream Contamination Issues

Upstream contamination issues are extremely difficult to prevent and even if detected are difficult to locate. Evaluation of raw water data collected for MORs is the easiest manner in which to detect upstream contamination issues because the data is already collected for treatment purposes. In fact, high total Coliform readings signaled a potential issue recently that the City identified and removed.

An upstream monitoring and warning system could be established to attempt to detect spill event type contamination early enough to cease intake prior to the

DRAFT

contamination reaching the WTP. However, given the imminent conversion to the KWA supply, the period of full time use would likely be far too short to achieve payback on the capital expenditures.

B. TREATMENT PROCESS

1. Operational Recommendations

- Coagulation and flocculation polymer aids: The 2002 Treatability Study suggested the use of coagulation and flocculation polymer aids. These polymer aids were shown in the 2002 Treatability Study to increase TOC removal and thereby reduce THMFP. Further evaluation will be completed during jar testing.
- Discontinue softening bypass: The City was previously bypassing a portion of flow around the softening basins because hardness levels did not warrant softening of the full stream. However, this practice was discontinued because it was believed the bypass stream was contributing to chlorine demand and preliminary data has supported that belief. Chlorine demand dropped 0.5 – 1.0 mg/l following elimination of the bypass stream in early November 2014.
- Soften with lime and soda ash: Research has shown that enhanced softening with both lime and soda ash may provide additional TOC removal. The efficacy of this option will be evaluated during jar testing.
- Disinfection of filter beds: In case there has been microbial growth it is recommended the filters be 'shock' treated with chlorine and rinsed. A chlorine injection point was added upstream of the filters during the first segment of Phase II so future growth in the filters should not be an issue.
- Optimization of all existing treatment processes: Depending on bench scale testing conditions and results, slight modifications to all treatment processes might in order to replicate lower DPBFP.

2. Infrastructure Change Recommendations

- Fix and/or replace faulty ozone equipment: Since the ozone equipment was installed it has not been used extensively so the hope is that major components remain in good condition and the system can be easily modified to restore proper functionality. The City has scheduled the equipment manufacturer to field inspect the system on December 15, 2014.
- Change disinfectant to chloramine or chlorine dioxide: If other options prove to be ineffective, conversion to another disinfectant should be fully evaluated. Various characteristics of chloramination indicate an advantage over chlorine dioxide, but a full analysis would provide clarity as to which would be preferred.
- Install pre-oxidant chemical feed: Hydrogen peroxide as a pre-oxidant can enhance the activity of the ozone. This option is listed as a consideration only if problems continue with ozonation.
- Repair upstream sewer leak: a sewer leak upstream of the WTP intake was discovered and has already been repaired by the City.

C. DISTRIBUTION SYSTEM

Recommendations will be incorporated into this report when available. It is anticipated details will be provided for the following topics. [To be completed]

1. ***Manage Water Age***
   a) ***Storage Tanks***
   b) ***Residence Time in Pipes***

2. ***Reduce Disinfectant Demand***
   a) ***Flushing***
   b) ***Cast Iron Pipes***

3. ***Water Modeling of Recommendations***

Determine best flushing locations to reduce water age
Changes to storage tank operating levels to reduce water age
Valves to close/add to improve pressure zones, reduce recirculation
Optimization of pump station use – smaller pumps? Shut down?
Evaluate booster disinfection

A number of actions have already been taken in terms of the distribution system. Water main flushing efforts were increased until late November when freezing weather became prevalent. Also, numerous valves that were broken in the closed position and believed to have been contributing to stagnant water were replaced.

D. BOOSTER DISINFECTION

Decreasing chlorine feed at the WTP and adding booster disinfection in the distribution system is an alternative intended to reduce the reaction time at higher concentrations of chlorine to reduce DPB formation. Extensive looping and branching within the existing system complicate how to best implement and utilize booster disinfection. Water system modeling is recommended to determine the most effective feed point locations and dosages. Further discussion and details will be provided when the distribution evaluation results are available.

E. CATEGORIZATION OF ACTIONS

Considering that the Flint River is being used as the water source only until the KWA supply is available (expected late 2016), options to address high THM formation that require new construction or extensive time to implement are not preferred. On the other hand, the City understands THM sample results to date dictate that some action is necessary. Two categories have been developed to assist the City in prioritizing actions to take. Stage 1 consists of actions that can be completed relatively quickly without major construction and Stage 2 actions are either long term actions or solutions requiring major construction. Stage 1 actions are to be completed first followed by evaluation of the results prior to consideration of Stage 2 actions. Grouping of actions are shown in the table below.

TABLE 6 – ACTION PLAN		
	Action	**Purpose**
Stage 1	Troubleshoot ozone feed system	Reduce chlorine feed and increase TOC removal
	Bench scale jar testing	Optimize treatment process and evaluate possible modifications
	Discontinue softening bypass	Reduce chlorine demand
	Disinfect filters	Reduce chlorine demand
	Increased water main flushing	Reduce water age / stagnant water
	Water system modeling evaluation	Determine areas with high water age and reasons
	Implement coag. & floc. polymer aids, if appropriate	Increase TOC removal
	Modify booster disinfection feeds, if appropriate	Decrease water age
Stage 2	Repair ozone system	Reduce chlorine feed and increase TOC removal
	Continue increased water main flushing	Reduce water age / stagnant water
	Convert to lime and soda ash softening	Increase TOC removal
	Continue valve replacements based on water model	Reduce water age / stagnant water
	Change disinfectant to chlorine dioxide	Reduce THMFP
	Install pre-oxidant feed at intake	Optimize ozone disinfection, reduce chlorine
	Place priority on replacing cast iron water mains	Reduce chlorine demand

Samples were taken the week of November 17th for the 3rd quarter of testing. Although the City has begun implementation of Stage 1 actions, THM results are not expected to be noticeably affected since there has not been enough time for a response. The next quarter of sampling is due to be completed the third week in February. It is the City's intent to implement Stage 1 actions prior to the 3rd quarter of THM sampling.

Subject: RE: Contract S-4002 100% and S-4003 90% Submttals - MDEQ comments
Attachments: 02513 Steel Pipe_REV3 pg 15-16.pdf; awwa C-604.pdf

I would like to revisit the conversation this morning regarding the pressure test. The new leakage method based on AWWA 604-11 the 66" pipe would allow 55 gal/mile leakage in a 2 hour period. The current specified method in section 02315 would allow roughly 0.2 gal/mile leakage in a 2 hour period depending on the pressure (150 to 350 psi) and the(J) number of joints 1 per mile to 12 per mile (welded joints do not count so only the valves count on the 66" line, but if you count the hydrants, and air release valves, which are not normally counted, it could be 6-12 per mile depending on the section). Note that you would have to have about 165 joints per mile (an average of 1 joint every 32 feet) @ 350 psi to equal the 55 gal per 2 hours allowed by the new formula. For 150 psi, it would have to have the equivalent of 252 joints per mile to get the 55 gal leakage in 2 hours that is allowed by the new method. The current specification indicates to test at the pressure equal to the pressure class listed on the drawings, where the new version would say test at no more than 125% of the working pressured. The working pressure is not defined anywhere so is that the pressure class of the pipe, or the pressure within the pipe that is expected during operation?

The 60" would be somewhat similar to the 66", except the pressures would be lower on the 60" pipe.

With that being said will the MDEQ allow the current specifications to remain or do we need to still reference AWWA 604-11 for testing even though the allowable leakage is well above what we are allowing.

Subject: Contract S-4002 100% and S-4003 90% Submttals - MDEQ comments

We've completed the review of both projects and the only significant issues that resulted were the Leakage Test formulas that Mike Prysby identified in his review of S-4005. When the corrected specs are received, I am prepared to issue the permit for S-4002. If I have them by early afternoon on Monday, June 23rd, I can bring the permitted plans and specifications to the June 24th meeting. I'm willing to replace the corrected section of the spec into the previously submitted specs if that is easier. Emailing them to me would be fine.

Thanks,

Daryl J. Gotham, P.E.
Michigan Department of Environmental Quality
Office of Drinking Water & Municipal Assistance
Saginaw-Bay District Office

weekly basis. All quality control tests conducted by the manufacturer for each production run of pipe shall be submitted to the Engineer on a weekly basis.

2. Welding Reports for each field welded joint shall be submitted to Engineer on a daily basis. The Welding Report shall include: weld joint station number based on the record drawings; date of weld; welder's name and signature; and actual weld size at four quadrants of pipe and total number of weld passes.
3. When a section of pipe and appurtenances has been completed and bedding materials is in place, provide the appliances, facilities, and water required for performing the specified pressure and leakage tests, as well as deflection testing.
4. After testing is complete drain the pipeline without injury to the work or surrounding area.
5. Contractor will be required to fully uncover a total of ten (10) joints, selected at random by the Engineer, so that the Engineer can visually inspect joints after welding from the pipe interior to verify integrity of welding and joint coating. Additional joints may be required to be uncovered, without limit, if problems are observed at the uncovered joints.

B. Pressure Test:
1. Subject all newly laid pipe or any valved sections of it to a hydrostatic pressure equal to the pipe pressure as indicated on the Contract Drawings.
   a. Test Duration: 2 hours minimum, 6 hours maximum.
   b. Slowly fill each section with potable water.
   c. Expel all air from the pipe by means of taps at the highest elevations.
   d. Plug the taps.
   e. Remove and replace any cracked or defective pipe discovered during test.
   f. The test pressure must hold for the duration of the test.
   g. Repeat the pressure test until satisfactory.
   h. Provide pipe manufacturer's test plugs or proper size and number, of adequate thickness with proper ribbing and stiffening for test pressures specified.
   i. Pressure testing may be done in conjunction with the leakage testing.

C. Leakage Test:
1. After completion of the pressure test, conduct a leakage test to determine the quantity of water lost under the specified leakage test pressure.
   a. Leakage test pressure is the maximum operating pressure of the section under test and is based on the elevation of the test gauge.
   b. Duration of each leakage test: Minimum of 2 hours in addition to the pressure test period.
2. Allowable leakage in gal/hr for pipelines: Not greater than that determined as follows:

   Allowable Leakage (Gal/Hr) = (J X D X Sqrt (P)) / 7400

   Where:

   J is the total Number of flanged, gasket, or push-on joints in tested length (excluding welded joints).

   D is the Pipe diameter in inches.

   P is the Average test pressure in psig.

Sqrt is the Square root operator.

3. Leakage is defined as the quantity of water supplied in the newly laid pipe or any valved section under test that is necessary to maintain the specified leakage test pressure after the pipe has been filled with potable or raw water and the air expelled.
4. All visible leaks are to be repaired regardless of the amount of leakage.
5. When leakage testing is performed against closed sectioning valves, the test shall be performed on each side of the valves independently.
6. Leakage testing may be done concurrently with the pressure testing.

D. Deflection Testing and Report:
1. After completion of construction and backfilling, prior to pressure and leakage testing, deflection testing is required for each pipe segment.
   a. Maximum allowable internal deflection is 3 percent (pipe out of round).
   b. A deflection testing report is required for each pipe section identified by the corresponding pipe section listed in the approved lay schedule or according to the record drawings.
   c. Failure to pass the deflection testing will require reworking of the pipe bedding, backfill and compaction at no cost to the Owner. Severe violations, as determined solely by the Engineer/Owner shall require removal and replacement of the unsatisfactory piping at no cost to the owner.

E. Weld Testing Report:
1. After completion of welding, prior to pressure and leakage testing, an inspection report of each field weld, for both the inside and the outside of the pipe at the weld, is required where any field welding has occurred (restrained joints, access manholes, etc.)
   a. The location of the weld is to be indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings.
   b. The report shall have the information for both the inside and the outside of each particular weld coordinated such that they both are located together in the report.
   c. A photograph of each weld location is to be included in the report with the date, and location indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings.

F. Exterior Joint Protection or Pipe Repair Report:
1. After completion of shrink wrapping each welded joint or exterior pipe repair, prior to backfilling, an exterior inspection report of each joint protection and repair is required.
   a. The location of the joint (or repair area) is to be indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings.
   b. A photograph of each joint or repair location is to be included in the report with the date, and location indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings.

AWWA Standard

This document is an American Water Works Association (AWWA) standard. It is not a specification. AWWA standards describe minimum requirements and do not contain all of the engineering and administrative information normally contained in specifications. The AWWA standards usually contain options that must be evaluated by the user of the standard. Until each optional feature is specified by the user, the product or service is not fully defined. AWWA publication of a standard does not constitute endorsement of any product or product type, nor does AWWA test, certify, or approve any product. The use of AWWA standards is entirely voluntary. This standard does not supersede or take precedence over or displace any applicable law, regulation, or codes of any governmental authority. AWWA standards are intended to represent a consensus of the water supply industry that the product described will provide satisfactory service. When AWWA revises or withdraws this standard, an official notice of action will be placed on the first page of the classified advertising section of *Journal AWWA*. The action becomes effective on the first day of the month following the month of *Journal AWWA* publication of the official notice.

American National Standard

An American National Standard implies a consensus of those substantially concerned with its scope and provisions. An American National Standard is intended as a guide to aid the manufacturer, the consumer, and the general public. The existence of an American National Standard does not in any respect preclude anyone, whether that person has approved the standard or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standard. American National Standards are subject to periodic review, and users are cautioned to obtain the latest editions. Producers of goods made in conformity with an American National Standard are encouraged to state on their own responsibility in advertising and promotional materials or on tags or labels that the goods are produced in conformity with particular American National Standards.

CAUTION NOTICE: The American National Standards Institute (ANSI) approval date on the front cover of this standard indicates completion of the ANSI approval process. This American National Standard may be revised or withdrawn at any time. ANSI procedures require that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of publication. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute, 25 West 43rd Street, Fourth Floor, New York, NY 10036; (212) 642-4900, or e-mailing info@ansi.org.

Committee Personnel

The Steel Water Pipe-Manufacturers Technical Advisory Committee (SWPMTAC) Task Force for Development and Maintenance of ANSI/AWWA C604, which developed this standard, had the following personnel at the time:

Nash Williams, *Chair*

J. Almos, Ameron International, Rancho Cucamonga, Calif.	(AWWA)
S.A. Arnaout, Hanson Pressure Pipe Inc., Dallas, Texas	(AWWA)
H.H. Bardakjian, Consultant, Glendale, Calif.	(AWWA)
M. Bauer, Tnemec Company, North Kansas City, Mo.	(AWWA)
R.J. Card, Consultant, Sugar Hill, Ga.	(AWWA)
R.R. Carpenter, American SpiralWeld Pipe Company, Birmingham, Ala.	(AWWA)
D. Dechant, Consultant, Aurora, Colo.	(AWWA)
J.A. Doty, RTLC Piping Products Inc., Kosse, Texas	(AWWA)
A. Fletcher, Tyco Water, Southbank, Australia	(AWWA)
R.W. Geary, Tek-Rap Inc., Houston, Texas	(AWWA)
B. Hansen, National Welding Corporation, Midvale, Utah	(AWWA)
B. Keil, Northwest Pipe Company, Portland, Ore.	(AWWA)
S. Lamb, Nickel Institute, Huntington, W.Va.	(AWWA)
J. Luka, American SpiralWeld Pipe Company, Columbia, S.C.	(AWWA)
R. Mielke, Northwest Pipe Company, Raleigh, N.C.	(AWWA)
R.N. Satyarthi, Baker Coupling Co. Inc., Los Angeles, Calif.	(AWWA)
H.R. Stoner, Consultant, North Plainfield, N.J.	(AWWA)
B. Vanderploeg, Northwest Pipe Company, Portland, Ore.	(AWWA)
D.R. Wagner, Consultant, St. Louis, Mo.	(AWWA)
B. Nash Williams, National Welding Corporation, Midvale, Utah	(AWWA)
J.A. Wise, Canus International Sales Inc., Surrey, B.C.	(AWWA)

The Standards Committee on Steel Pipe, which reviewed and approved this standard, had the following personnel at the time of approval:

John H. Bambei Jr., *Chair*

Dennis Dechant, *Vice-Chair*

John L. Luka, *Secretary*

Foreword

This foreword is for information only and is not a part of ANSI/AWWA C604.*

I. Introduction.

I.A. *History.* This standard pertains to the in-ground installation of steel pipelines for use in the distribution and transmission of water, air, and other products in water system facilities. It has been prepared by the AWWA Standards Committee on Steel Pipe, initially formed as Committee A7A in 1939. At that time, the Steel Water Pipe Manufacturers Technical Advisory Committee was organized as a subsidiary group to function as a source of technical information for the parent committee. Committee A7A and its successors, Committee 8310D and the AWWA Standards Committee on Steel Pipe, have assumed responsibility for all AWWA standards and manuals pertaining to steel pipe, fittings, linings and coatings, field installations, and related items.

In 1996 the AWWA Standards Council directed the Standards Committee on Steel Pipe to develop a standard for the installation of steel pipelines and their appurtenances used in water treatment or conveying facilities. The first edition of AWWA C604 was approved by the AWWA Board of Directors on Feb. 12, 2006. This second edition was approved on Jan. 23, 2011.

I.B. *Discussion.* ANSI/AWWA C604 includes all types of steel pipe 4 in. (100 mm) in diameter and larger typically used in the water industry, regardless of pipe manufacturing source. With adequate quality assurance, pipe manufactured in a fabricator's shop or in a steel-pipe mill is suitable for water utility service. Pipe produced in a fabricator's shop or pipe mill for installation in accordance with ANSI/AWWA C604 shall meet the stringent design, quality control, and testing requirements of AWWA Manual M11 and ANSI/AWWA C200. Shop and mill-fabricated pipe made from materials and in accordance with the quality control measures stipulated in AWWA Manual M11 and ANSI/AWWA C200 will ensure fabricated pipe of high quality.

I.C. *Acceptance.* In May 1985, the US Environmental Protection Agency (USEPA) entered into a cooperative agreement with a consortium led by NSF International (NSF)† to develop voluntary third-party consensus standards and a

* American National Standards Institute, 25 West 43rd Street, Fourth Floor, New York, NY 10036.
† NSF International, 789 North Dixboro Road, Ann Arbor, MI 48105.

Not for Resale, 06/24/2014 14:10:54 MDT

certification program for direct and indirect drinking water additives. Other members of the original consortium included the American Water Works Association Research Foundation (AwwaRF, now Water Research Foundation*) and the Conference of State Health and Environmental Managers (COSHEM). The American Water Works Association (AWWA) and the Association of State Drinking Water Administrators (ASDWA) joined later.

In the United States, authority to regulate products for use in, or in contact with, drinking water rests with individual states.† Local agencies may choose to impose requirements more stringent than those required by the state. To evaluate the health effects of products and drinking water additives from such products, state and local agencies may use various references, including

1. An advisory program formerly administered by USEPA, Office of Drinking Water, discontinued on Apr. 7, 1990.
2. Specific policies of the state or local agency.
3. Two standards developed under the direction of NSF, NSF/ANSI 60, Drinking Water Treatment Chemicals—Health Effects, and NSF/ANSI 61, Drinking Water System Components—Health Effects.
4. Other references, including AWWA standards, *Food Chemicals Codex*, *Water Chemicals Codex*,‡ and other standards considered appropriate by the state or local agency.

Various certification organizations may be involved in certifying products in accordance with NSF/ANSI 61. Individual states or local agencies have authority to accept or accredit certification organizations within their jurisdiction. Accreditation of certification organizations may vary from jurisdiction to jurisdiction.

Annex A, "Toxicology Review and Evaluation Procedures," to NSF/ANSI 61 does not stipulate a maximum allowable level (MAL) of a contaminant for substances not regulated by a USEPA final maximum contaminant level (MCL). The MALs of an unspecified list of "unregulated contaminants" are based on toxicity testing guidelines (noncarcinogens) and risk characterization methodology (carcinogens). Use of Annex A procedures may not always be identical, depending on the certifier.

---

* Water Research Foundation, 6666 W. Quincy Ave., Denver, CO 80235.

† Persons outside the United States should contact the appropriate authority having jurisdiction.

Not for Resale, 06/24/2014 14:10:54 MDT

ANSI/AWWA C604 does not address additives requirements. Thus, users of this standard should consult the appropriate state or local agency having jurisdiction in order to

1. Determine additives requirements, including applicable standards.
2. Determine the status of certifications by parties offering to certify products for contact with, or treatment of, drinking water.
3. Determine current information on product certification.

II. Special Issues.

II.A. *Application.* ANSI/AWWA C604, Standard for Installation of Buried Steel Water Pipe—4 In. (100 mm) and Larger, can be used as a reference when making extensions to existing distribution or transmission systems or when constructing new distribution or transmission systems using steel pipe. It is not the intent for this standard to be used as a contract document, but it may be used as a reference in contract documents. It is based on a consensus of the committee on the minimum practice consistent with sound, economical service under normal conditions, and its applicability under any circumstances must be reviewed by a responsible engineer. The standard is not intended to preclude the manufacture, marketing, purchase, or the use of any product, process, or procedure.

III. Use of This Standard. It is the responsibility of the user of an AWWA standard to determine that the products described in that standard are suitable for use in the particular application being considered.

III.A. *Purchaser Options and Alternatives.* The following items should be provided by the purchaser.

Considerable supplemental information is required in conjunction with the use of this standard, including, but not limited to, purchaser's documents consisting of detailed plans and specifications. The purchaser's documents should cover, as a minimum, detailed instructions pertaining to all references in this standard to "as specified" and "in accordance with the purchaser's documents." In addition, the purchaser shall provide specific supplementary information to the purchaser's documents regarding the following:

1. Standard used—that is, ANSI/AWWA C604, Installation of Buried Steel Water Pipe–4 In. (100 mm) and Larger, of latest revision.
2. Whether compliance with NSF/ANSI 61, Drinking Water System Components—Health Effects, is required.
3. Pipe design criteria and type of pipe ends.

Provided by IHS
No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

4. Pipe-laying schedules, line drawings, markings, appurtenances, vaults, valves, and existing utilities.

5. Pipe bedding specification and drawing details.

6. Inspection for pipe joints, protective coatings and linings, and pipe zone compaction.

7. Surface restoration.

8. Special handling requirements.

9. Details of other federal, state or provincial, and local requirements (Sec. 4.2).

10. Whether proof testing of the weld after backfill method is required for the project-specific conditions, including testing protocols (Sec. 4.4.4.2). NOTE: The exterior protective joint coating, backfill material, use of thin-wall pipe, and welding procedures should be considered with this process.

III.B. *Modification to Standard.* Any modification of the provisions, definitions, or terminology in this standard must be provided by the purchaser.

IV. Major Revisions. Major revisions made to the standard in this edition include the following:

1. The format has been changed to AWWA standard style.

2. Added Standards Council materials language as new Sec. 4.2.

3. Revision of trench widths, Sec. 4.4.2.3.

4. Revision of rock conditions, Sec. 4.4.2.6.

5. The section on unsuitable subgrade material was revised, Sec. 4.4.2.10.

6. An additional paragraph was added on pipe installation, Sec. 4.4.3.

7. A section on pipe on steep grades was added, Sec. 4.4.3.6.

8. Revisions were made to the section on pipe placement for rubber-gasketed joints (Sec. 4.4.4.1.1).

9. Revisions were made to the section on pipe placement for welded lap joints (Sec. 4.4.4.2).

10. An additional paragraph was added regarding the weld-after-backfill method (Sec. 4.4.4.2).

11. The procedure for flanged joints was revised (Sec. 4.4.4.4.).

12. A new Figure 5 was added for bolt torque sequence.

13. Revisions were made to the welded joints section (Sec. 4.4.4.9).

14. Additional information was added on heat-shrink sleeve installation in Sec. 4.4.4.13.3.

15. Additional information was added regarding cement mortar for field joints and repairs (Sec. 4.4.4.13.4).

16. Sec. 4.4.5, Fitting installation, was deleted.

17. Revisions were made to the section on backfilling (Sec. 4.4.6).

18. Figure 5, Pipe bedding, was replaced with new Figure 6, Trench cross section.
19. A new Table 1 on soil stiffness categories was added.
20. Revisions were made to test restrictions, Sec. 5.2.1.
21. A new section on affidavit of compliance was added, Sec. 6.2.

V. Comments. If you have any comments or questions about this standard, please call AWWA Engineering and Technical Services at 303.794.7711, FAX at 303.795.7603, write to the department at 6666 West Quincy Avenue, Denver, CO 80235-3098, or e-mail at standards@awwa.org.

ANSI/AWWA C604-11
(Revision of ANSI/AWWA C604-06)

American Water Works Association

AWWA Standard

Installation of Buried Steel Water Pipe—4 In. (100 mm) and Larger

SECTION 1: GENERAL

Sec. 1.1 Scope

This standard provides the field installation guidelines for buried steel water pipe, 4 in. (100 mm)* and larger.

The information contained in this standard is intended to be used as a guide to assist in the installation of steel water pipe.

1.1.1 *Conditions that may require additional considerations.* Installations that require special attention, techniques, and materials are not covered by this standard. Some of these installations are

1. Piping through rigid walls or structures.
2. Connections to appurtenances.
3. Piping on supports or on piles above or below ground.
4. Piping subject to significant thermal stresses.
5. Treatment plant or pump-station piping.
6. Industrial piping.
7. Piping in seismic areas.

* Metric conversions given in this standard are direct conversions of US customary units and are not those specified in the International Organization for Standardization (ISO) standards.

Copyright © 2011 American Water Works Association. All Rights Reserved.

No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

8. Piping in high-density, stray-current environments.
9. Piping through unstable soils or soils subject to sliding or soil drag.
10. Piping subject to excessive live loads.
11. Piping with cover less than 3 ft (900 mm).
12. Piping installed by horizontal directional drilling (HDD).

Sec. 1.2 Purpose

The purpose of this standard is to provide the minimum requirements for the installation of buried steel water pipelines, including inspection, unloading, handling, storage, and testing.

Sec. 1.3 Application

This standard is intended to cover typical pipeline construction practices that are deemed adequate for the satisfactory installation of steel water pipelines. Individual project requirements can vary substantially and should always be thoroughly reviewed before bidding or construction startup. For this reason, some practices discussed in this standard may not be suitable for all project conditions, and in some cases, specialized installation techniques may be required that are beyond the scope of this standard.

SECTION 2: REFERENCES

This standard references the following documents. In their latest editions, the referenced documents form a part of this standard to the extent specified herein. In case of conflict, the requirements of this standard shall prevail.

SECTION 3: DEFINITIONS

The following definitions shall apply in this standard:

1. *Bell-and-spigot or lap joint:* A circumferential joint in which one of the members joined overlaps the other.

2. *Bevel:* The angle formed between the prepared edge of a pipe end and a plane perpendicular to the longitudinal axis of the pipe. Bevels are generally used for butt welding of pipe ends.

* American Welding Society, 550 N.W. LeJeune Road, Miami, FL 33126.

Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

3. *Butt joint:* A pipe joint in which the two pipe ends are in the same plane and do not overlap. This joint configuration is commonly beveled and usually includes a backup ring on the side opposite of which field joint welding is to be performed.

4. *Constructor:* The party that provides the work and materials for placement or installation.

5. *Dewatering:* The removal of water in and around construction operations. This usually pertains to underground water within construction zones, which can adversely affect the construction activities.

6. *Fillet weld:* A weld of approximately triangular cross section, the throat of which lies in a plane disposed approximately 45° with regard to the surface of the parts joined. The size of the fillet weld is expressed in terms of the width, in inches, of one of its adjacent fused legs (the shorter leg, if unequal).

7. *Final backfill:* Final backfill begins at top of initial backfill and continues to the top of trench or finished grade.

8. *Grade:* The elevation of a structure or pipeline invert (bottom of the flowline) at a specific location. This elevation is usually measured relative to established survey points at the project.

9. *Haunch:* The area of the trench that begins at the bottom of the pipe and generally extends up to ⅓ of the pipe diameter.

10. *Initial backfill:* Initial backfill begins at the top of the bedding or haunch area and continues to the top of pipe.

11. *Manufacturer:* The party that manufactures, fabricates, or produces materials or products.

12. *Mechanical cutting:* The severing of materials using a power cut-off saw with a thin flat blade having a continuous line of teeth on its edge or high-speed abrasive disk.

13. *Miter:* The angle between the cut of a pipe end and a line drawn perpendicular to the longitudinal axis of the pipe. Miters are used to fabricate elbows and to facilitate pipe laying at changes in horizontal or vertical alignment.

14. *Nominal diameter or size:* The commercial designation or dimension by which pipe is designated for simplicity. Commonly, it is the finished inside diameter after lining.

15. *Nominal weight per foot (for pipe):* The theoretical weight, per foot, calculated from the wall thickness, as distinguished from the actual and measured weight per foot of the finished pipe. Unit weights of 0.284 lb per cubic inch for

Copyright © 2011 American Water Works Association. All Rights Reserved.
Provided by IHS
No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

steel sheet or 490 lb per cubic foot for steel plate shall be used when calculating weight per foot. Unit weights of 0.087 lb per cubic inch, or 150 lb per cubic foot for cement mortar, shall be used when calculating weight per foot.

16. *Pipe bedding:* The material immediately under the pipeline and by which the pipeline is supported. This material is usually of a specific description and may simply be the reuse of the originally excavated material.

17. *Pipe embedment:* The area comprising the pipe bedding plus the initial backfill.

18. *Plain-end pipe:* Pipe that is not threaded, beveled, belled, or otherwise given a special end configuration.

19. *Plans:* Drawings normally prepared by an engineer employed or retained by the purchaser or system-operator showing the location and details for the construction of the pipeline and appurtenances.

20. *Purchaser:* The person, company, or organization that purchases any materials or work to be performed.

21. *Purchaser's documents:* Detailed requirements established by the purchaser or designee, outlining minimum acceptable standards for design, manufacture, quality of installation, or any other criteria the purchaser deems necessary for the procurement of the product required. Installation specifications may incorporate this standard by reference, but should also include specification requirements for matters not covered by the standard.

22. *Random lengths:* Pipe lengths as produced in a pipe mill, to which no special treatment is given to make the lengths uniform.

23. *Special section:* Any piece of pipe other than a normal full-length straight section. This includes but is not limited to elbows, pipe with outlets, short pieces, reducers, adapter sections with special ends, and other nonstandard sections.

24. *Specified lengths:* Sections of finished pipe, the length dimensions of which do not vary from a fixed figure specified by the purchaser by more than the tolerance set forth.

25. *Supplier:* The party that supplies material or services. A supplier may or may not be the manufacturer.

26. *Underground utilities:* Previously installed utilities that are located within the right-of-way of a pipeline or structure. These utilities commonly include gas, power, water, cable TV, sewer, fiber-optic cable, steam lines, and telephone lines.

Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

27. *Utility location service:* The cooperative organization of major utilities to provide services for the location and safe construction practices surrounding their respective utilities. These utilities often provide a site representative during construction when deemed necessary by the utility.

SECTION 4: REQUIREMENTS

Sec. 4.1 Permeation

The selection of materials is critical for potable water, wastewater, and reclaimed water service, and for distribution piping in locations where there is likelihood the pipe will be exposed to significant concentrations of pollutants composed of low-molecular-weight petroleum products, organic solvents, or their vapors. Documented research has shown that pipe materials (such as polyethylene, and polyvinyl chloride) and elastomers, such as those used in jointing gaskets and packing glands, are subject to permeation by low-molecular-weight organic solvents or petroleum products. If a potable water, wastewater, or reclaimed water pipe must pass through such a contaminated area or an area subject to contamination, consult with the manufacturer regarding permeation of pipe walls, jointing materials, and so on *before* selecting materials for use in that area.

Sec. 4.2 Materials

Materials shall comply with the requirements of the Safe Drinking Water Act and other federal regulations for potable water, wastewater, and reclaimed water systems as applicable.

Sec. 4.3 Preconstruction Planning

The installation of steel pipelines usually involves multiple suppliers and subcontractors that have varying preparation requirements. For this reason a preconstruction meeting is strongly recommended to confirm and coordinate the critical path aspects of all involved parties. In particular, pipe and valve materials are usually manufactured to fit specific locations of the project and often require an extended lead time for the purchase of raw material, drawing preparation, and drawing approvals that must precede construction activities. Any preconstruction planning meeting initiated by the purchaser should include all essential suppliers and subcontractors. During the meeting, a schedule should be confirmed that is agreeable to all parties. The meeting also affords all parties the opportunity to elaborate on their respective preparations, such as procurement of materials, preparation

Copyright © 2011 American Water Works Association. All Rights Reserved.
Provided by IHS
No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

of drawings, and submittals. The constructor shall be required to provide the starting location and direction of construction. Care should be taken when preparing the construction schedule as later changes in construction plans may affect shop drawings, laying schedules, delivery dates, and other parties. Shop drawings must be approved by the constructor and purchaser prior to pipe production.

Sec. 4.4 Installation

4.4.1 *Alignment and grade.* Pipelines shall be laid and alignment maintained to the required horizontal line and vertical grade established in the purchaser and constructor approved layout drawings for the project subject to allowable tolerances. Valves and special sections shall be installed at the required locations unless field conditions warrant otherwise and such changes are agreed to by the purchaser and constructor. Valve-operating stems shall be oriented in a manner to allow proper operation.

4.4.1.1 Prior investigation. Prior to excavation, investigation shall be made to the extent necessary to determine the precise location of existing underground utilities, structures, and conflicts. This will require the constructor to contact the utility location service for proper coordination and location of utilities and then perform excavations to verify the elevation at the point of intersection, if the utility falls within the proposed pipe excavation. In addition, care shall be exercised during excavation to avoid damage to existing structures, which may not be identified by the utility location service. Special precautions shall be taken when the pipeline being installed crosses or is adjacent to a facility that is cathodically protected. When obstructions that are not shown on the purchaser's documents are encountered during the progress of work and interfere so that an alteration is required, such alterations or deviation in line and grade or the removal, relocation, or reconstruction of the obstructions shall be performed in accordance with the purchaser's documents.

4.4.1.2 Clearance. When crossing existing pipelines or other structures, alignment and grade shall be adjusted in accordance with the purchaser's documents. Installed pipe and structures shall provide clearance as required by federal, state or provincial, and local regulations. Wherever possible, pipe and structures shall have a minimum clearance of 12 in. (300 mm) from existing pipelines or structures to allow for proper compaction.

4.4.2 *Trench construction.* The trench shall be excavated to the required alignment, depth, and width specified or shown on the purchaser's documents and shall be in conformance with all federal, state or provincial, and local regulations for the protection of workers.

Copyright © 2011 American Water Works Association. All Rights Reserved.

Not for Resale, 06/24/2014 14:10:54 MDT

4.4.2.1 Trench preparation. Trench preparation shall proceed in advance of the pipe installation. The amount of open trench length allowed may be limited by the amount of nonbackfilled pipe, the purchaser's documents, safety, and public impact considerations (such as traffic, slope, etc.).

4.4.2.1.1 Discharges from trench dewatering pumps shall be directed away from the trench, in order not to affect trench stability, and shall be in accordance with federal, state, and local point discharge requirements.

4.4.2.1.2 Excavated material shall be placed in a manner that will not obstruct the work, endanger workers or the public, or obstruct sidewalks, driveways, roadways, and other structures. If obstruction of such structures becomes necessary, the constructor shall plan for alternative means to accommodate the public. Placement of excavated material shall be done in compliance with federal, state or provincial, and local regulations.

4.4.2.2 Pavement removal. Removal of pavement and road surfaces shall be a part of the trench excavation. The amount removed shall depend on the width of trench required for installation of the pipe, including safety requirements and the dimensions of the area into which valves, specials, manways, or other structures will be installed. Methods such as sawing, drilling, or chipping shall be used to ensure the breakage of pavement along straight lines.

4.4.2.3 Trench width. The width of the trench at the top of the pipe shall be as dictated by the purchaser's documents or as necessitated by safety requirements. In any case, the trench width shall provide ample clearance to permit the pipe to be installed and joined properly and to allow the backfill to be placed in accordance with the purchaser's documents and shall be adequate to ensure elimination of voids in the haunch area, and proper placement and compaction of initial backfill materials. If mechanical compaction is required of the initial backfill materials, trench width shall provide clearance on each side of the pipe to allow room for compaction equipment. The trench width at the bottom of the pipe will be governed by the space required for compaction or consolidation equipment. In addition, trenches shall be of such extra width, when required, to permit the placement of sheeting, bracing, and appurtenances as required by the safety requirements of the agency having jurisdiction.

4.4.2.4 Depth. The trench shall be excavated and bedding installed. The bedding shall provide uniform support for the full length of the pipe barrel, except that a slight depression may be provided to facilitate the removal of pipe slings or other lifting devices without damaging the pipe coating. Pipe bedding and backfill

material shall be installed so as to avoid abrasion or other damage to the coating on the pipe.

4.4.2.5 Bell holes. Holes for the pipe bells shall be provided at each joint. Holes shall be adequately sized for completing any external coatings, but shall be no larger than necessary to allow joint assembly. If the pipe joints are welded or coupled, the bell holes shall provide adequate clearance for welding or assembly and subsequent external coatings.

4.4.2.6 Rock conditions. If excavation of rock is necessary, all rock shall be removed to provide a clearance below and on each side of all pipe, valves, and fittings. The minimum clearance shall be 6 in. (150 mm) for pipe with an outside diameter (OD) up to 24 in. (600 mm) and 10 in. (250 mm) for pipe with an OD greater than 24 in. (600 mm). When the excavation is completed, a layer of appropriate subgrade material (see Sec. 4.4.6.1) shall be placed on the bottom of the trench, graded, and compacted to provide uniform support for the entire length of pipe and the placement of the loose bedding material up to the bottom of the pipe. These clearances and bedding procedures shall also be observed for pieces of concrete or masonry and other debris or subterranean structures, such as masonry walls, piers, or foundations that may be encountered during excavation.

4.4.2.7 Previous excavations. Should the trench pass over a sewer or other previous excavation, the trench shall be sufficiently compacted to provide support equal to that of the native soil or conform to other regulatory requirements in a manner that will prevent damage to the existing installation.

4.4.2.8 Blasting. Blasting for excavation shall be permitted only after securing approval(s) and establishing the hours of blasting as required by the purchaser's documents. The blasting procedure, including protection of existing utilities, persons, and property, shall be in strict accordance with federal, state or provincial, and local regulations.

4.4.2.9 Protection of existing structures. Temporary support, adequate protection, and maintenance of all underground and surface structures, drains, sewers, and other obstructions encountered in the progress of the work shall be provided in accordance with the purchaser's documents and applicable regulations.

4.4.2.10 Unsuitable subgrade material. When the subgrade is found to include ashes, cinders, refuse, organic material, or other unsuitable material, such material shall be removed to at least 6 in. (150 mm) below the bottom of the pipe for pipe with an outside diameter (OD) up to 24 in. (600 mm) and 10 in. (250 mm) for pipe with an OD greater than 24 in. (600 mm). The removed material shall be

No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

replaced with clean, suitable subgrade material in accordance with the purchaser's documents or as directed by the purchaser. Once unsuitable material is removed or replaced, the bedding material shall be placed and graded so that the bedding will provide uniform support for the entire length of the pipe.

4.4.2.11 Unstable subgrade. When the bottom of the trench or the subgrade consists of material that is unstable to such a degree that it cannot be removed, a foundation for the pipe and/or appurtenance shall be constructed in accordance with the purchaser's documents or as directed by the purchaser.

4.4.3 *Pipe installation.* Proper implements, tools, and facilities shall be provided and used for the safe and convenient performance of the work. All pipe, fittings, and valves shall be lowered carefully into the trench by means of a backhoe or crane, using nylon slings, guide ropes, or other suitable tools or equipment, in such a manner as to prevent damage to the pipe, protective coatings, and linings. Pipe shall not be dropped or dumped into the trench. The trench shall be dewatered prior to installation of the pipe and maintained until the pipeline is substantially covered as necessary to prevent pipe from floating.

At all times during construction of the pipeline, precautions shall be taken to prevent damage to the protective coating. Coating damaged during installation shall be repaired in accordance with this and other applicable AWWA standards.

4.4.3.1 Examination of material. All pipe, fittings, coatings, and appurtenances shall be examined carefully for damage and other defects upon arrival at the installation site and immediately before assembly in the trench. Defective materials shall be marked and held for final disposition as required by the purchaser's documents.

4.4.3.2 Pipe ends. All deleterious materials shall be removed from the ends of each pipe. For bell-and-spigot pipe, the outside of the spigot end and the inside of the bell shall be wiped clean and dry so that it is free from dirt, sand, grit, and other foreign matter before the pipe is installed.

4.4.3.3 Pipe cleanliness. As installation progresses, no debris, tools, clothing, or other materials shall be allowed to accumulate in the pipe during construction and shall be prevented from entering the pipe while being placed in the trench.

4.4.3.4 Direction of bells. It is common practice to lay lap-welded pipe joints with the spigot facing the direction in which work is progressing. For rubber-gasketed pipe, common practice is to lay the pipe joints with the bell facing the direction in which work is progressing to prevent debris from being scooped into the bell. The direction of the bells is not functionally related to the direction of flow within the system.

4.4.3.5 Pipe end caps. When pipe laying is not in progress, cover, cap, or secure the open ends of pipe where required. If used, the end caps shall remain in place until the trench work proceeds. When pipe caps are in place, care must be taken to prevent pipe flotation should the trench fill with water.

4.4.3.6 Pipe on steep grades. On grades exceeding 10 percent, the pipe should be laid uphill or otherwise held in place by approved methods.

4.4.4 *Joint assembly and testing.* Proper implements, tools, and facilities shall be provided and used for the safe and convenient performance of the work. The types of joints covered in this standard include gasketed, flanged, sleeve couplings, split-sleeve couplings, expansion joints, and welded joints, all of which have specific applications. The joint types required for a project will be dictated by the purchaser's documents.

The joint assembly shall be coated with a compatible material according to the coating manufacturer's recommendations and the applicable AWWA standard.

4.4.4.1 Rubber-gasketed joints. Gasketed joints consist of a bell-and-spigot end configuration formed directly into the steel pipe cylinder or attached to the steel pipe cylinder. The spigot end includes a groove that retains an O-ring gasket. The gasket groove and the bell end of the mating pipe shall be cleaned thoroughly. When the spigot is inserted into the bell, the gasket compresses between the steel surfaces to form a watertight seal. Rubber-gasketed joints shall be assembled as described in Sec. 4.4.4.1.1 and illustrated in Figures 1 and 2.

4.4.4.1.1 Pipe placement for rubber-gasketed joints. Mark the outside of the pipe at the quarter points for the minimum stab depth. This dimension is provided on the shop joint detail drawings. Lift the pipe using the appropriate method. On steep slopes, it may be advisable to use slings as chokers. Visually inspect the O-ring gasket for any visible defects, cuts, tears, or excessive stretching. Stretch the O-ring gasket over the pipe spigot end by hand or by using a dull pry bar (to avoid cuts or tears), and then carefully seat the gasket into the O-ring groove on the spigot (see Figure 1). After placement, relieve tension in the gasket by running a dull object, such as a wooden dowel, between the gasket and the spigot groove around the pipe circumference several times. Just prior to stabbing, apply a light coat of vegetable-based pipe lubricant to the spigot end exterior and the bell end interior, being sure to keep the joint clean. The spigot end shall be stabbed approximately 1 in. (25 mm) into the bell end, with the two mating pieces in reasonably straight alignment (see Figure 2). The spigot shall then be engaged the appropriate distance. Rubber-gasketed pipe may be joined using a choker sling

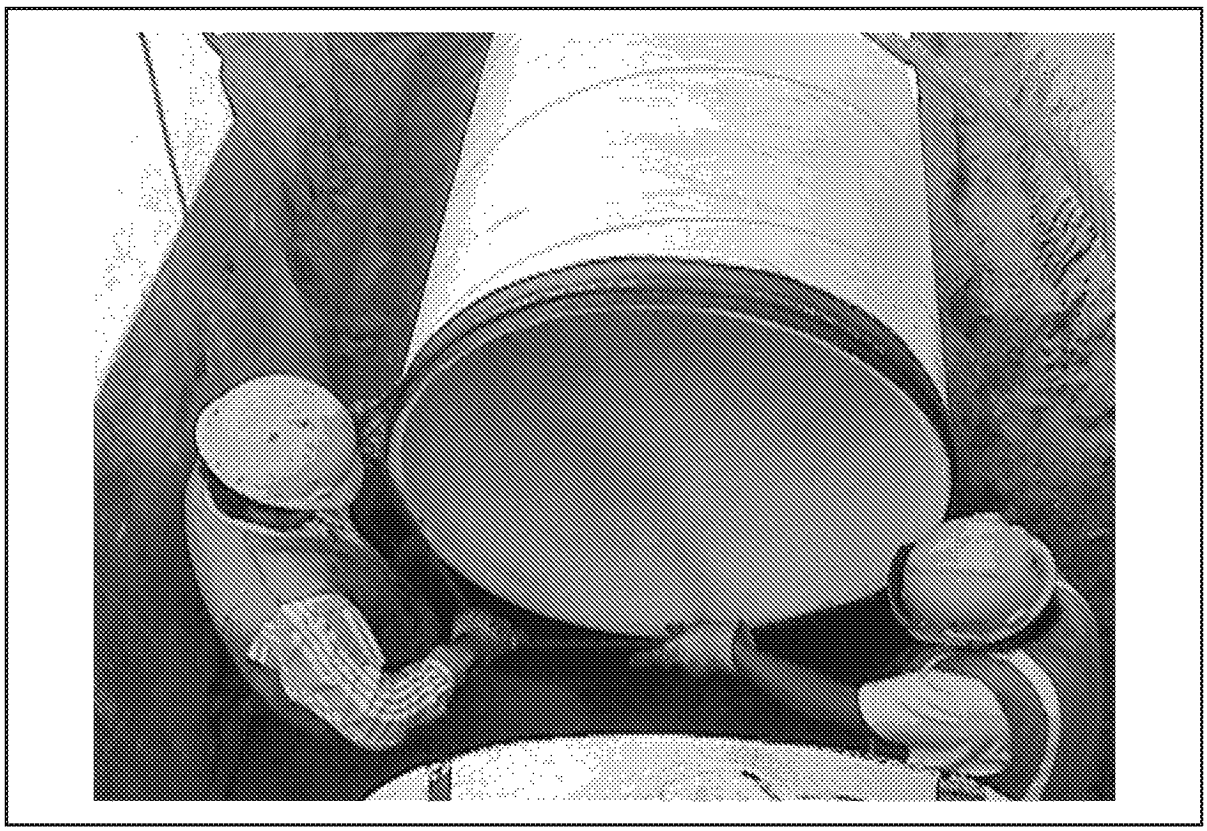

Figure 1 Typical O-ring gasket assembly

attached to the excavator bucket and drawing the pipe joint to full engagement. Small-diameter pipe spigots may be pushed into the bell with a long pry bar. Large-diameter pipe may be pushed into the bell using the bucket of the excavator and appropriately sized timber, which is used to equalize the assembly loads and reduce the risk of damage to the bell, or pulled together using a winch or come-a-long. As each length of pipe is placed in the trench, the pipe shall be brought to the correct line and grade. After the joint is properly engaged, deflect the joint, if required, within the prescribed limits in Sec. 4.4.4.3 (see Figure 4) or the purchaser's documents. The pipe shall be secured in place with approved backfill material.

4.4.4.1.2 Rubber-gasketed joint testing. After the pipe has been laid to final grade, the rubber-gasketed joint shall be tested using a feeler gauge. This test ensures the gasket has not rolled out of the groove, or "fish-mouthed." Perform this test by inserting a feeler gauge from the outside of the joint between the bell and spigot until reaching the gasket. Continue completely around the pipe circumference to ensure the gasket is properly seated. Do not force the feeler gauge past the

Not for Resale, 06/24/2014 14:10:54 MDT

gasket. The only purpose of the feeler gauge test is to determine whether the gasket has rolled out of the groove during installation; it is not to determine the amount of clearance between the spigot and the bell.

4.4.4.1.3 Repair of rubber-gasket joints. If the gasket has disengaged, the joint shall be pulled apart, and the gasket shall be removed and checked for any damage. Reinstall the gasket, or if damaged, install a new gasket following the procedure in Sec. 4.4.4.1.1. Alternatively, if a pipe segment cannot be removed, seal-weld the interior of the joint, or insert a rolled steel round bar into the flare of the bell and seal-weld the round bar to the bell and spigot.

4.4.4.2 Pipe placement for welded lap joints. Mark the outside of the pipe at the quarter points for the required stab depth range. This dimension is provided on the joint detail drawings. It should be noted that interior lap-welded pipe should never be engaged to the point where the weld would be within 1 in. (25 mm) of the tangency of the point of bell radius. See Sec. 4.4.4.9.1 for more detail. Standard lap-welded joints consist of a single fillet weld made on either the interior or exterior of the pipe. On steep slopes, it may be advisable to use slings as chokers. Lower the pipe segment, bell end first, at an approximate 5° to 10° angle relative to the previously laid pipe segment. This will allow the bell edge to overlap the spigot (of the previously laid pipe) to the proper stab depth mark. On large-diameter pipe, a small tack weld may be placed onto the exterior of the bell and spigot at the "field top." This tack will act as a hinge that will guide the remainder of the bell insertion as the pipe is lowered (see Figure 3). The tack welds may remain as part of the permanent weld if the welder is properly qualified and the weldment meets the requirements of ANSI/AWWA C206 and the purchaser's documents. Under certain circumstances, some constructors may choose to insert the spigot straight into the bell by methods described in Sec. 4.4.4.1.1. As each length of pipe is placed in the trench, the joint shall be assembled and checked for stab depth, and the pipe shall be brought to correct line and grade. After the joint is properly engaged, deflect the joint, if required, within the prescribed limits in Sec. 4.4.4.3 or the purchaser's documents. If required by the purchaser's documents, proceed with the exterior or interior welding of the joint in accordance with ANSI/AWWA C206. If required by the purchaser's documents, perform nondestructive testing of the weld. Upon completion of the welding and/or weld testing, apply field joint coating per the appropriate standard. The pipe shall then be secured in place with approved initial backfill material. After backfilling the pipe, the interior lining at the joint shall be completed.

Weld-after-backfill is also an acceptable method for welding the pipe. This method involves assembling the pipe joint as described above, deflecting the joint if required, applying the appropriate exterior protective coating to the joint, and backfilling the pipe prior to welding the interior joint. Welding is done on the inside of the pipe after the backfill is complete. With inside single-welded joints, this method can reduce or eliminate thermal stress issues associated with welding pipe exposed to the sun or atmosphere. Once interior welding and/or weld testing is complete, the interior lining at the joint may be completed. Project-specific conditions and materials can vary, such as the exterior protective joint coating, backfill materials, use of thin-wall pipe, and welding procedures, which may warrant testing to verify the method at the start of construction.

4.4.4.3 Joint deflection. When it is necessary to deflect rubber-gasketed or lap-welded pipe joints from a straight line in either the horizontal line or vertical grade, the amount of joint deflection shall not exceed that amount which would affect the watertight seal for rubber-gasketed joints or that amount which results in a field weld closer than 1 in. (25 mm) to the nearest point of tangency to a bell radius with a minimum insertion of 1 in. (25 mm) for lap-welded pipe or in accordance with the purchaser's documents (see Figure 4). The pull is further described as the dimension in which the pipe joint insertion varies when measured from opposite sides (180° apart). This pull shall not diminish the minimum required insertion dimension. By using this joint pull, pipe can be aligned with long-radius curves as well as minor offsets during pipeline construction.

4.4.4.4 Flanged joints. Flanges commonly used for steel water pipe are slip-on type ring flanges. Flanges are designed for use with rubber or nonasbestos gaskets. Both the size and type of gasket material are controlling factors in the design of bolted joints, and the AWWA Manual M11 and ANSI/AWWA C207 recommendations should be followed.

Regardless of the type of gasket being used or the materials of construction, certain basic procedures must be followed if the joint is to be assembled, tested, and easily put into operation. Regardless of the method used to apply stress to the bolts or studs, the following procedure should be followed carefully:

1. Inspect the gasket seating surfaces. Look for tool marks, scratches, or pitting by corrosion, and make sure that the gasket seating surface is appropriate for the type of gasket being used. Deep radial tool marks on a gasket seating surface are virtually impossible to seal, regardless of the type of gasket used. This type of damage shall be cause for rejection, and the flange shall be repaired or replaced.

Not for Resale, 06/24/2014 14:10:54 MDT

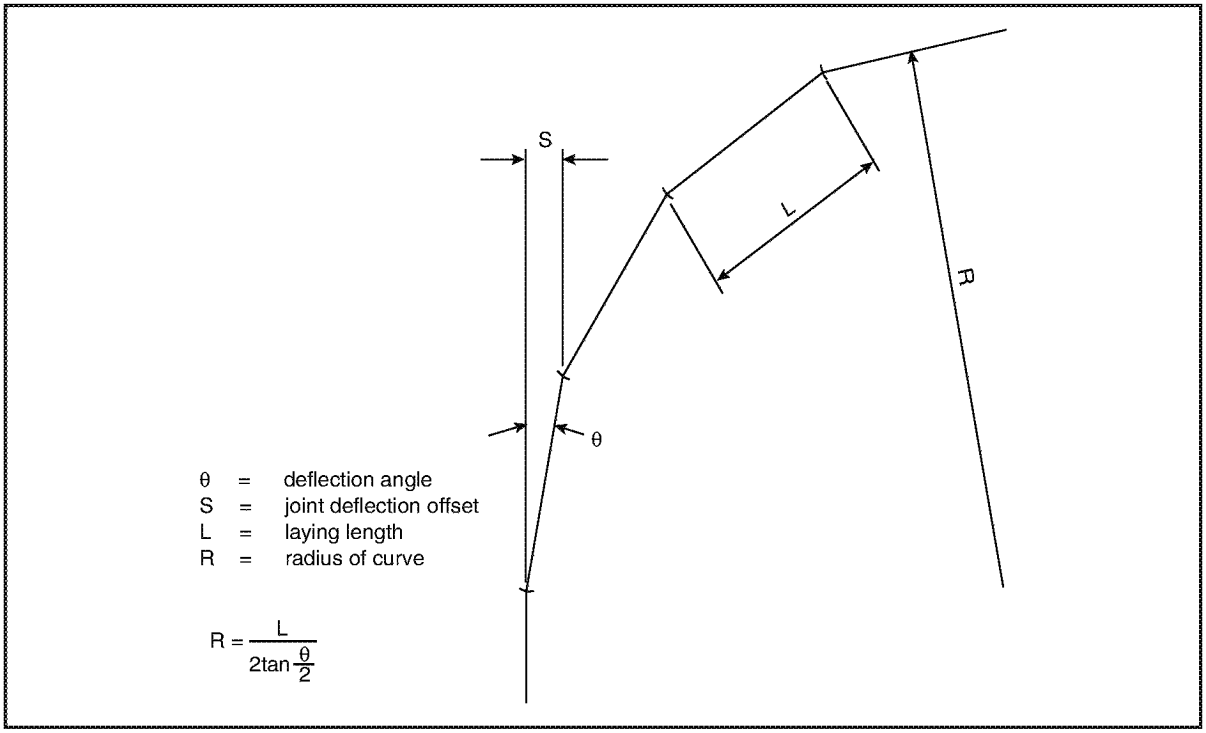

Figure 4 Joint deflection

2. Inspect the gasket. Confirm that the material is as required by the purchaser's documents, and look for defects or damage to the gasket.

3. Inspect and clean each stud or bolt, nut, washer, and the facing on the flanges against which the nuts will rotate. Look for severe galling, pitting, etc. If any of the above-mentioned items are damaged beyond repair, replace the item.

4. Lubricate all thread contact areas and nut facings. Do not construct the joint without applying the proper lubrication to the threaded surfaces and to the nut facings. The lubricant is necessary to provide a low coefficient of friction for installation and to achieve proper torque values.

5. With ring gasket installation, loosely install the stud bolts on the lower half of the flange. Insert the gasket between the flange faces to allow the bolts to center the gasket on the assembly. Install the remaining bolts and nuts.

With full-face gaskets, at least two bolts or studs must be placed in the top half of one flange, then the gasket placed over these bolts before mating the flanges. The remaining bolts and nuts can be installed to a hand-tight condition through the flange and gasket.

6. Torque the bolts up to a maximum of 30 percent of the final torque value required, following the recommended sequence shown in Figure 5. The recommended torque values are provided in AWWA Manual M11. Number the bolts

NOTES: 1. Patterns similar to the above are followed on larger flanges.
2. For insulating flanges, refer to the manufacturer's recommendations.

Figure 5 Bolt torque sequence

so that the torquing requirements can be followed. With any gasket material, it is extremely important to follow a proper bolting sequence.

7. Repeat step 6, increasing the torque to approximately 50 to 60 percent of the final torque value required.

Copyright © 2011 American Water Works Association. All Rights Reserved.
Provided by IHS
No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

8. Continue with a rotational pattern of retorquing all studs or bolts to the desired amount until no further rotation of the nuts can be achieved at the prescribed torque load. This may require several retorquings, because as one bolt is torqued, it will relieve the stress on the adjacent bolt until equilibrium is achieved.

4.4.4.5 Transition couplings. Transition couplings may be required for joining different types or sizes of pipe. Such transition devices are typically available. When ordering, the actual outside diameter of the pipe ends shall be given.

4.4.4.6 Tapping sleeves. Tapping sleeves are a means of making branch connections to existing pipelines. The procedures for proper installation of tapping sleeves shall follow the manufacturer's recommendations.

4.4.4.7 Sleeve couplings. Sleeve couplings are used on pipelines of all diameters. Follow the manufacturer's recommendations and ANSI/AWWA C219 for their installation.

4.4.4.8 Split-sleeve coupling. Split-sleeve couplings are used on pipelines of all diameters. Follow the manufacturer's recommendations and ANSI/AWWA C227 for their installation.

4.4.4.9 Welded joints. Welding shall meet the requirements of ANSI/AWWA C206 and the purchaser's documents for the project. The need for welded joints will vary by project and will be identified in the purchaser's documents. The single lap weld joint is the most commonly used configuration for joint restraint.

Joint welding procedures, welders, and welding operators shall be qualified under tests prescribed in ANSI/AWWA C206. Preheat and interpass temperature maintenance is often required prior to welding and during welding to prevent cracking. The specific preheat and interpass temperature maintenance requirements will vary depending on the welding process, steel specification, steel thickness, and metal temperature and should be determined by using AWS D1.1.

A protective cover shall be draped over the pipe near the vicinity of welding if protection of the coating is required. Field welding in the interior of steel pipe is ordinarily limited to 30-in. (750-mm) or larger pipe, to provide for access and egress. When personnel are working inside, ventilation shall be provided in strict accordance with federal, state or provincial, and local regulations.

Wire brushing is usually sufficient to remove any dirt or light rust to prepare the surface for welding. Small tack welds can be used to hold the pipe in position for welding, provided the tacks are sound and meet the requirements of ANSI/AWWA C206. The number of weld passes needed to complete the joint is a function of the steel wall thickness, type of joint, and type of welding. Interior welding

Not for Resale, 06/24/2014 14:10:54 MDT

using the weld-after-backfill method may require more than one weld pass to limit temperature at the joint and damage to the exterior coating.

4.4.4.9.1 Welded lap joints. There are several welding configurations for the lap joint. The single lap weld joint is completed using a single weld that can be accomplished on either the inside or outside of the pipe joint. Inside welding is frequently limited to pipe diameters of 30 in. (750 mm) and larger. The nominal engagement of a lap-welded joint is 2 to 3 in. (50 to 75 mm) deep with a minimum required final overlap between the bell and the spigot after pullout of 1 in. (25 mm) or three times the thickness of the belled pipe, whichever is greater. The typical pullout is 1 in. (25 mm), but in all cases, the 1-in. (25-mm) minimum required overlap must be maintained. No part of any field weld shall be closer than 1 in. (25 mm) to the nearest point of tangency to a bell radius. The allowable angle of deflection is provided in Sec. 4.4.4.3.

4.4.4.9.2 Welded butt joint. Welded butt joints are sometimes specified for special design conditions. Butt joints are usually single-V-groove ends and can include a backup ring. The backup ring will be located on the pipe interior for smaller-diameter pipe and on the exterior or interior for larger pipe (over 30 in. [750 mm] in diameter). Field joints shall be assembled so that longitudinal seams in adjacent pipes are offset from each other by at least five times the thickness of the thicker of the pipes being joined. Single-V-groove butt joints may be welded from the outside of the pipe, or from the inside of the pipe if the diameter is large enough. The backing rings may be left in place after welding. Line-up clamps can assist in the pipe installation. The installation procedure of field-welded butt joints is basically identical to the above except that when the two ends have touched, caution should be exercised to ensure that the proper root opening is achieved and the pipe is firmly secured in position prior to installing subsequent pipe segments.

4.4.4.9.3 Welded butt-strap joints. Where welded butt-strap joints are used, the butt straps shall have a minimum plate thickness equal to the thinnest member being joined and shall be fabricated from steel listed in ANSI/AWWA C200 and meeting the purchaser's pipe design requirements. In accordance with ANSI/AWWA C206, the strap shall have a minimum width of 4 in. (100 mm) for pipe less than 24 in. (600 mm) in diameter and 6 in. (150 mm) for pipe 24 in. (600 mm) nominal diameter and larger. The minimum lap between pipe ends and the edge of the butt strap shall be 1 in. (25 mm) for pipe less than 36 in. (900 mm) in nominal diameter and 2 in. (50 mm) for pipe 36 in. (900 mm) nominal diameter and larger.

Not for Resale, 06/24/2014 14:10:54 MDT

For butt-strap joints, the longitudinal seams of adjacent pipe sections may be in alignment provided that the butt-strap seams are offset from the pipe seams by at least five times the thickness of the thicker member involved in the joint. The butt strap may be welded on the pipe exterior, interior, or both.

4.4.4.9.4 Welded joint testing. If required by the purchaser's documents, nondestructive joint testing is performed by visual inspection, magnetic particle, or dye penetrant testing of single-fillet welds, magnetic particle testing of butt-welded joints, or air testing of double-fillet welds. Vacuum look box testing has been used on a limited basis as an alternative method for fillet welds and butt welds. Radiographic testing and ultrasonic testing have been used on a limited basis as alternative methods for testing butt joints. Radiographic testing is not recommended for butt joints with backing and lap joints. The test method shall be specified in the purchaser's documents. These test methods and repair of defective welds are further described in ANSI/AWWA C206.

4.4.4.10 Pipe cutting. Prior to cutting, pipe shall be checked to ensure it is within the necessary tolerance for proper assembly with the adjoining pipe. If the adjoining pipes are not within the needed longitudinal tolerance, either replace the segment or use an alternative field joint such as a butt strap. Cutting pipe for insertion of valves, fittings, or closure pieces shall be done in conformance with all safety requirements. Cutting may be performed by a power abrasive saw, oxygen-acetylene torch, plasma arc, air-arc, or other suitable means. The resulting cut end will require corrective preparation before assembly with the adjoining pipe. Cut ends and rough edges shall be ground smooth.

4.4.4.11 Expansion joints. Provisions shall be made for the expansion and contraction of welded pipelines exposed to extreme temperature differential during installation. Failure to provide for this expansion and contraction can result in undesirable levels of thermal stress in the steel. Where individual pipe lengths are anchored and sleeve-type couplings are used for field joints, the joints must allow enough movement so that expansion and contraction is not cumulative over an excessive length. Thermal expansion is usually accommodated for trench-laid welded pipelines to avoid the accumulation of expansion and contraction during installation. These joints usually include a lengthened bell, which is welded during the coolest part of the day and only after all adjacent pipe has been welded and buried.

4.4.4.12 Bonding of joints. When required by the purchaser's documents, the bonding of nonwelded joints shall be used to make the line electrically

Copyright © 2011 American Water Works Association. All Rights Reserved.

Not for Resale, 06/24/2014 14:10:54 MDT

continuous. Electrical continuity allows for monitoring of the pipeline. Electrical bonding jumpers may be welded in the field to provide electrical continuity between adjoining pipes. The bond welds should be kept close to the ends of the pipe to allow joint end coatings to cover the bonding jumpers.

4.4.4.13 Protective coatings at field joints. Generally, pipe lengths are coated and lined in the shop, excluding only the pipe ends that are completed in the field. After field assembly, the exterior and interior joint ends shall be completed with coatings that are compatible with the original coating system of the pipe and in conformance with the applicable AWWA standards. The type of pipe coating and end coating shall be determined by the purchaser's documents. Various pipe end coatings and linings are available, which are further described in ANSI/AWWA C203, ANSI/AWWA C205, ANSI/AWWA C209, ANSI/AWWA C210, ANSI/AWWA C216, ANSI/AWWA C217, ANSI/AWWA C222, and ANSI/AWWA C602. For application and repair of these materials, follow the appropriate AWWA standard and the manufacturer's recommendations. Three commonly used materials for pipe end field coatings are heat-shrink sleeves (ANSI/AWWA C216), hand-applied tape (ANSI/AWWA C209), and hand-applied cement mortar (ANSI/AWWA C205). Field joint and repair applications for these materials are briefly described by this standard.

4.4.4.13.1 Tape wrapping field joints. Tape is provided in various widths for various needs but is generally 6 to12 in. (150 to 300 mm) wide. Taping can be completed at any temperature as long as the roll body temperature of the tape is maintained above 70°F (21°C). The procedure for proper tape wrapping of field joints is fully described in ANSI/AWWA C209 and is summarized as follows:

1. Make sure the joint to be taped is complete, the gasket is checked, the weld is inspected, and the metal is cool to a temperature below 130°F (54°C).
2. Clean the area to be taped to make sure all moisture has been removed.
3. Prime all around the joint, including several inches on both sides beyond the area where the actual joint tape will be applied. Place filler material at all pipe joints and at irregularities to create a smooth surface. (Lap welds, where the exterior is a full thickness weld, and butt welds do not require filler material.)
4. Start in a downhill direction of the pipe and wrap two complete layers around the pipe until overlapping the starting point by a minimum of 4 in. (100 mm). Cut the tape so as not to damage the field coating. The start and stop spots do not need to be much farther than 10° to 15° from the top centerline.

5. Make sure the tape around the joint is wrinkle-free and stretched taut. It is preferable to keep the welded bonding jumper close to the pipe ends and wrap the whole area with the tape as the joint is wrapped.

6. Make sure that partial rolls of tape go around at least one complete wrap.

7. Inspect the completed wrap using a holiday detector.

4.4.4.13.2 Taped pipe repairs. Many taped pipelines include a three-layer system. The first layer that actually bonds to the pipe is typically a black tape. The second layer is a higher-density tape to give durable protection during handling and service. The third layer is a tape that provides good protection to the inner layers of tape. In most cases, this outer layer is white. The three layers are generally supplied in three different colors so that in the event of damage, the colors will assist in determining the extent of damage to the total tape system. The procedure for properly taped pipe repairs is fully described in ANSI/AWWA C209 and is summarized as follows:

1. Minor wrinkles, scuffs, or any tears located on the edge of the tape that do not go past the overlap area are generally acceptable. These conditions listed still give the tape a full film thickness, and it is not practical to remove the high-density machine-applied tape and replace it with a softer patch-type material.

2. If a tear occurs in only the outer layer, repair the damaged area with one layer of tape with a minimum overlap of 4 in. (100 mm) onto the existing coating system.

3. If the damaged coating area shows evidence of going further into the coating system, use the repair method outlined below.

a. Cut away the damaged tape at an angle tangent to the surface of the pipe so that the tape system is not cut or damaged any further.

b. Wipe clean the area to be taped and make sure it is dry and free from dirt.

c. Prime the area to be repaired and let the primer dry to a tackiness before applying the repair tape. The primed area shall be of sufficient size to extend beyond all applied patch tape.

d. Cut the tape to such a size that it extends beyond the damaged area for a minimum of 4 in. (100 mm) in all directions around the area to be repaired. Apply the tape starting at the center and working toward the edge, making sure to smooth out all wrinkles. Make sure the primed area extends past the tape edges.

e. Only one layer of repair tape is required on damages that affect the outer layer of tape. If a second layer of tape is required to complete the patch, place the second layer of patch material over the first extending a minimum of 1 in.

Not for Resale, 06/24/2014 14:10:54 MDT

(25 mm) in all directions past the first layer patch. It will always require two pieces of tape to accomplish this overlap process.

f. Perform a holiday test on the repair area.

4.4.4.13.3 Heat-shrink sleeves on field joints. Heat-shrink sleeves are used to protect field joints from moisture and oxidation. The procedure for proper application of heat-shrink sleeves is fully described in ANSI/AWWA C216 and is summarized as follows:

1. Clean the area of the heat-shrink sleeve to remove all moisture, soil, and foreign materials.

2. If required by the heat-shrink sleeve installation instructions, place filler material at pipe joints and at irregularities to create a smooth surface. If required by the heat-shrink sleeve installation instructions or purchaser's documents, abrade polyurethane coatings (tape systems do not need to be abraded) and/or preheat the joint as required.

3. Fit the sleeve around the joint.

4. Heat the sleeve to shrink and seal the sleeve to the joint.

5. Using rollers, remove all wrinkles to ensure that the sleeve has intimate contact with the pipe.

4.4.4.13.4 Cement mortar for field joints and repairs. Pipe ends and areas needing repairs shall be clean of deleterious materials and the surface prepared for the cement mortar in accordance with ANSI/AWWA C205. When feasible, interior cement mortar for field joints and repairs shall be applied after the trench has been backfilled. Typically for 24 in. (600 mm) and larger diameters, the inside recess is pointed with mortar. On smaller diameters, the shoulder of the bell is "buttered" with a stiff mortar, and a swabbing device, such as an inflated rubber ball wrapped with burlap, is placed in the previously laid section of the pipe. The ball has a wire attached to it, and the wire is threaded through the next pipe section to be laid. When the sections are joined, the spigot squeezes the mortar into position against the shoulder of the bell. Then the swabbing device is pulled past the joint by means of the wire, and the excess mortar is wiped away, leaving a smooth, flush inside joint. For exterior joints, cement mortar shall be poured in the joint space through a grout band that is wrapped around the joint and firmly strapped onto both sides after field joint assembly. Repairs to the exterior mortar coating of the pipe shall be made during pipe installation and before backfilling. Cracks in cement–mortar-lined steel pipe are a common occurrence. These cracks are most commonly shrinkage cracks, which are caused when the mortar dries out.

--`,,`,,`,,

Contributing factors may be unprotected pipe ends, rough handling, or thermal stresses caused by weather. It is important to keep the pipe ends capped; small amounts of water can be added to the inside when the pipe is subjected to hot, dry climates. Cracks of 1/16 in. (1.6 mm) or less are acceptable by ANSI/AWWA C205. If cracks exceed 1/16 in. (1.6 mm), a slurry mixture can be brushed over the cracked area prior to filling the pipeline. The material requirements and application procedures of cement mortar for field joints and general repairs are described in ANSI/AWWA C205. Do not fill pipe for 72 hr after the last concrete repair.

4.4.5 *Thrust restraint.* The need for thrust restraint is a design consideration that is not covered by this standard. Such restraint typically is provided by welded joints.

4.4.6 *Backfilling.* It is important to identify components of the trench and recognize how they relate to the overall backfilling process and material requirements. Pipe bedding, haunch zone, initial backfill, and final backfill materials are project-specific and can be composed of different materials with varying compaction levels. Subgrade improvement is typically only required when unacceptable material causes an unstable trench bottom. The subgrade improvement depth (if required) is generally specified or directed by the purchaser. Pipe bedding is typically 2 in. to 6 in. (50 mm to 150 mm) in depth directly under the pipe and is loosely consolidated to provide uniform support for the pipe. The haunch zone begins at the bottom of the pipe and is typically placed to a depth of up to 1/3 of the pipe diameter. Haunch area materials are typically the same material as the initial backfill. Proper installation of the haunch zone material provides uniform support of the pipe and has the greatest impact on limiting deflection of the pipe. Voids in the haunch zone of the pipe are unacceptable. Initial backfill typically begins at the top of the bedding or haunch zone and continues to the top of the pipe. Final backfill begins at the top of the initial backfill and proceeds to finished grade. The purchaser should specify if the initial backfill is to be placed above the top of the pipe. Placing initial backfill over the top of the pipe provides a consistent environment encapsulating the pipe, which may aid in the corrosion protection of the pipe. For this case, the initial backfill is typically placed 6 in. (150 mm) over the top of the pipe for pipe smaller in diameter than 24 in. (600 mm) and 12 in. (300 mm) over the top of the pipe for pipe 24 in. (600 mm) in diameter and larger. Typically acceptable final backfill material and compaction requirements are detailed in purchaser's documents, but in all cases, stones or rocks larger than 3 in. (75 mm) in diameter for mortar-coated pipe and 3/4 in. (19 mm) in diameter for dielectric-

Not for Resale, 06/24/2014 14:10:54 MDT

coated pipe may damage the coating and shall not be placed in direct contact with the pipe. From 6 in. to 12 in. (150 to 300 mm) above the top of the pipe to finish grade, material containing stones up to 8 in. (200 mm) in their greatest dimension may be used.

4.4.6.1 Pipe embedment and subgrade material. When the type of backfill material is not specified by the purchaser, the excavated material may be used provided the material meets the requirements of this standard. All pipe embedment and subgrade material shall be free from cinders, ashes, refuse, vegetable or organic material, frozen soil, boulders, rocks or stones larger than 3 in. (75 mm) in diameter for mortar-coated pipe and ¾ in. (19 mm) in diameter for dielectric-coated pipe, or other unsuitable materials.

4.4.6.1.1 Initial backfill may be class SC1, SC2, and SC3, see Table 1, and shall be densified around the pipe in accordance with Figure 6. Minimum density levels of the backfill are important in preventing deflection of the pipe. The density shall be specified by the purchaser or shall be as determined in AWWA M11 by the soil class used and the recommended pipe deflection limits. Regardless of the method of densification used, materials shall be brought up at substantially the same rate on both sides of the pipe. When installing pipe 36 in. (900 mm) and larger, confirm that the backfill properly supports the pipe haunch area. Take care to ensure that the pipe is not floated or displaced before backfilling is complete.

Pipe deflection should be monitored to verify that the proper installation techniques are being used.

4.4.6.1.2 Cohesive soils shall be compacted with mechanical equipment or hand tamping. Care shall be taken not to damage coatings during compaction. Proper equipment and care in placement will ensure the required compaction under the haunch of the pipe. Initial backfill for pipe up to 48 in. (1,200 mm) in diameter shall be placed in layers of not more than 12 in. (300 mm) in thickness. Initial backfill for pipe larger than 48 in. (1,200 mm) in diameter shall be placed in layers not exceeding 24 in. (600 mm) in thickness and subject to meeting the compaction requirements.

4.4.6.1.3 Free-draining soils may be densified by mechanical equipment, hand tamping or tamping with water-using devices, or through methods such as water jets, immersion-type vibrators, or flooding. These soils are usually placed in a minimum of two layers, with the first layer placed loose to no higher than the spring line of the pipe. The thickness of the layers shall not exceed the penetrating depth of the vibrators if consolidation is performed by jetting and internal vibration.

4.4.6.1.4 Final backfill above the pipe embedment shall not be placed until the compaction of the pipe embedment backfill is satisfactorily complete. To prevent damage to the pipe, sufficient compacted backfill shall be placed over the pipe before allowing any type of vehicle over it.

NOTE: Loosely placed final backfill above the pipe may promote unwanted surface settlement, which could be detrimental to improvements subsequently placed over the trench.

4.4.6.2 Compaction. Care shall be taken to ensure compaction equipment does not damage the pipe coating. Ensure proper compaction of backfill to avoid ovalling of the pipe beyond the required limits.

4.4.6.3 Partial backfilling during testing. Newly installed pipelines are normally tested after backfilling. When unusual conditions require that pressure and leakage testing be accomplished before completion of backfilling, or with pipe joints accessible for examination, sufficient backfill material shall be placed over the pipe barrel between the joints to prevent movement, and due consideration shall be given to restraining thrust forces during testing.

4.4.7 *Flushing.* Foreign material left in pipelines during installation can result in valve or hydrant seat leakage during pressure tests. Every effort shall be made to keep lines clean during installation. Thorough flushing is recommended prior to a pressure test; flushing shall be accomplished by partially opening and closing valves several times under expected line pressure, with flow velocities adequate to flush foreign material out of the valves.

4.4.8 *Disinfection.* Newly installed mains carrying potable water shall be disinfected in accordance with ANSI/AWWA C651. Provisions shall be made to avoid contamination of existing mains by cross connection during testing/disinfection/flushing of newly installed mains.

NOTE: Discharge from flushing or disinfection shall be directed away from the pipe alignment so that trench stability is not affected and shall be in accordance with federal, state, and local point discharge requirements.

4.4.9 *Highway and railroad crossings.*

4.4.9.1 Casing pipe. When casing pipe is specified for highways or railroad crossings, the project shall be completed in accordance with applicable federal, state or provincial, and local regulations. In the case of railroad crossings, the project shall also comply with regulations established by the railroad.

4.4.9.2 Carrier pipe. The casing pipe and other pipe appurtenances shall be a minimum of 8 in. (200 mm) larger than the outside diameter of the steel pipe

Copyright © 2011 American Water Works Association. All Rights Reserved.
Provided by IHS
No reproduction or networking permitted without license from IHS

Not for Resale, 06/24/2014 14:10:54 MDT

bells to prevent damage during installation and to prevent pipe-to-casing contact. Carrier pipe may be pushed or pulled through the completed casing pipe. Spacers and/or insulator skids shall be placed around the carrier pipe to ensure approximate centering within the casing pipe and to prevent damage during installation or flotation. Care shall be exercised to avoid metal-to-metal contact. If the casing annulus is grouted, grout pressures and lifts must be maintained to avoid deflecting or collapsing the steel carrier pipe. Carefully monitor the carrier pipe during the grouting operation to verify the proper grouting techniques are being used.

4.4.10 *Subaqueous crossings.*

4.4.10.1 Subaqueous installations. When it is necessary to cross a body of water, the preferable practice is to dewater the area and proceed according to the conventional pipeline construction practices described in this standard. In the event the purchaser's documents allow subaqueous construction, the constructor is strongly advised to use an engineered system specifically developed for the pipe, crossing depth, intended cover, and means planned for such a crossing. The use of a restrained-type joint (welded or mechanical) is recommended. However, the additional details necessary for subaqueous construction are not covered in this standard.

SECTION 5: VERIFICATION

Sec. 5.1 Inspection

5.1.1 *Inspection on delivery.* All pipe and appurtenances are subject to inspection at the point of delivery. Material found to be defective because of manufacture or damage in shipment shall be recorded on the bill of lading and may be rejected. There shall be agreement between the purchaser and constructor regarding any necessary repairs. The purchaser shall be allowed to monitor the repairs prior to installation.

Sec. 5.2 Hydrostatic Field Testing

WARNING: The testing methods described in this section are specific for water-pressure testing. These procedures shall not be applied for air-pressure testing because of the serious safety hazards involved.

The main objective of a field hydrostatic pressure test (hydro test) is to check the watertightness of joints, as each length of pipe is shop tested per purchaser's documents. The hydro test can be performed after backfilling is complete and

Copyright © 2011 American Water Works Association. All Rights Reserved.
Provided by IHS
No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

at a purchaser-specified pressure above the design working pressure of the line. Where possible, bolted flexible joints should be left uncovered until the hydro test is complete.

5.2.1 *Test restrictions.* Test pressure shall not exceed 125 percent of working pressure unless taken into consideration in the design and shall never exceed pipe or thrust-restraint design pressures. The line shall be vented and care shall be taken to ensure that all air in the line escapes during the filling operation. The line shall be filled slowly to prevent water hammer.

Upon completion of filling with water, the hydrostatic test shall last at least 2 hr. Pipe with cement–mortar linings should be filled for a minimum of 24 hr prior to testing to allow for water absorption into the lining. Water absorption into linings and other factors may extend the duration required for a successful hydro test.

5.2.2 *Air removal.* Before applying the specified test pressure, air shall be expelled from all air vents along the section of piping being tested.

5.2.3 *Examination.* Any exposed pipe, fittings, valves, and joints shall be examined carefully during the test. In addition, the entire length of the pipeline shall be examined for movement, defects, and leaks that may appear at the surface. Any revealed damage or defective pipe, fittings, valves, or joints shall be repaired or replaced with sound material, and the test shall be repeated until satisfactory results are obtained.

5.2.4 *Allowable makeup water.* Makeup water shall be defined as the quantity of water that must be supplied into the newly laid pipe or any valved section thereof to maintain pressure within 5 psi (34.5 kPa) of the specified test pressure after the pipe has been filled with water and the air has been expelled. Makeup water shall not be measured by a drop in pressure in a test section over a period of time.

The allowable makeup water shall not exceed 10 gal per in. diameter per mi of pipe per 24 hr (0.93 L per mm diameter per km of pipe per 24 hr) as measured by the water required to maintain the specified test pressure.

NOTE: The air removal and test procedure above will expel most but not all air from the pipeline. This section assumes some air will remain in the pipeline during testing and provides for this condition.

5.2.5 *Valve seat leakage.* When testing against closed valves, makeup water per closed valve of 0.0078 gal/hr/in. (1.2 mL/hr/mm) of nominal valve size shall be allowed. This is in addition to the makeup water in Sec. 5.2.4. When testing against existing valves is necessary, some leakage can be expected and should not be the sole basis for rejection.

Copyright © 2011 American Water Works Association. All Rights Reserved.
Provided by IHS
No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

5.2.6 *Acceptance of installation.* Acceptance shall be determined on the basis of the hydro test. If any test of laid pipe requires makeup water greater than that specified, repairs or replacements shall be accomplished and the pipe retested.

5.2.6.1 All visible leaks shall be repaired regardless of the amount of leakage.

SECTION 6: DELIVERY

Sec. 6.1 Unloading, Handling, and Storage

Care shall be exercised when unloading, handling, and storing pipe. Nylon or protected slings at least 4 in. (100 mm) wide or padded forks shall be used to handle coated pipe. Cables, chains, ropes, or other equipment that is likely to damage pipe coatings shall not be used.

Coated pipe shall be handled, stored, and shipped in a manner that will prevent damage to the coating. If the coating is damaged during handling, storage, or shipping, it shall be repaired with the original or a compatible repair coating as recommended by the coating manufacturer and in accordance with the applicable AWWA standard.

All pipe, fittings, and accessories shall be loaded and unloaded carefully to avoid impact or damage. Under no circumstances shall such material be dropped.

6.1.1 *Secure pipe.* Before release of tie-downs around the pipe, the loads shall be checked to ensure the pipe is secure and stable.

6.1.2 *Padding.* Slings, hooks, and pipe tongs shall be padded and used in such a manner to prevent damage to the exterior surface or internal lining of the pipe, fittings, or related product.

6.1.3 *Internal bracing.* Pipe manufacturers provide internal bracing for handling and shipping purposes if required. The constructor should maintain the bracing and ensure its adequacy during installation. This bracing may or may not be adequate to limit pipe deflection during backfilling operations. The purchaser should specify the requirements for bracing if its use is desired to limit pipe deflection during backfilling.

6.1.4 *Jobsite storage.* Stored materials shall be kept safe from damage. The interior of all pipe, fittings, and other appurtenances shall be kept reasonably free from dirt or foreign matter at all times.

Coated pipe shall be protected from ultraviolet and weathering damage as recommended by the coating manufacturer. Coated pipe should never be placed,

dragged, or rolled directly on the ground. Padded skids, earthen berms, burlap sacks filled with sand, and old car tires are some of the means to adequately bunk the pipe at the jobsite. Pipe shall not be stacked without proper padding. Plastic caps on the pipe ends for pipe that is cement–mortar lined shall be left in place until just prior to installation.

Sec. 6.2 Affidavit of Compliance

The purchaser may require an affidavit of compliance or test reports from the constructor stating that the material installed or tests performed comply with all applicable requirements of this standard.

AWWA is the authoritative resource for knowledge, information, and advocacy to improve the quality and supply of water in North America and beyond. AWWA is the largest organization of water professionals in the world. AWWA advances public health, safety, and welfare by uniting the efforts of the full spectrum of the entire water community. Through our collective strength, we become better stewards of water for the greatest good of people and the environment.

Matt,

What is the status of the revised spec. or addendum that spells out the weld testing methodology? (based on your June 25th message below) Issuance of the Act 399 permit for Contract S-4002 is pending receipt of the revised spec or addendum.

Mike,

I received this message and the responses to Steve B.'s questions on the Surge Analysis. I never did receive the revised spec that Matt mentioned in the following message.

That sounds great. Yes I was informed of the testing methodology yesterday. I discussed this with American yesterday and I believe we are doing the magnetic particle testing. Once this is verified I will let you know and send the revised spec. These will either be in the addendum or on the original spec if we get it out prior to bidding. One way or another it will get placed in the spec.

As for the surge. Yes I spoke to the PM team yesterday and they are in the process of responding. I do not see any problems with providing a quick response.

Subject: RE: Contract S-4002 100% and S-4003 90% Submttals - MDEQ comments

Matt,
We do not have an objection with KWA wanting to use the more conservative leakage formula for the pipeline as opposed to the formula provided in AWWA C-604. We are also not opposed to the exclusion of the welded joints in the formula; however, since this results in a much lower leakage tolerance…. all welded joints need to be properly tested . The specification should clearly state an acceptable testing methodology such as radiography, sonograms, or magnetic particle testing.

Finally, it is our understanding that we will be receiving a response from Genesee County concerning our questions/comments from the updated surge analysis.

I would like to revisit the conversation this morning regarding the pressure test. The new leakage method based on AWWA 604-11 the 66" pipe would allow 55 gal/mile leakage in a 2 hour period. The current specified method in section 02315 would allow roughly 0.2 gal/mile leakage in a 2 hour period depending on the pressure (150 to 350 psi) and the(J) number of joints 1 per mile to 12 per mile (welded joints do not count so only the valves count on the 66" line, but if you count the hydrants, and air release valves, which are not normally counted, it could be 6-12 per mile depending on the section). Note that you would have to have about 165 joints per mile (an average of 1 joint every 32 feet) @ 350 psi to equal the 55 gal per 2 hours allowed by the new formula. For 150 psi, it would have to have the equivalent of 252 joints per mile to get the 55 gal leakage in 2 hours that is allowed by the new method. The current specification indicates to test at the pressure equal to the pressure class listed on the drawings, where the new version would say test at no more than 125% of the working pressured. The working pressure is not defined anywhere so is that the pressure class of the pipe, or the pressure within the pipe that is expected during operation?

The 60" would be somewhat similar to the 66", except the pressures would be lower on the 60" pipe.

With that being said will the MDEQ allow the current specifications to remain or do we need to still reference AWWA 604-11 for testing even though the allowable leakage is well above what we are allowing.

Subject: Contract S-4002 100% and S-4003 90% Submttals - MDEQ comments

We've completed the review of both projects and the only significant issues that resulted were the Leakage Test formulas that Mike Prysby identified in his review of S-4005. When the corrected specs are received, I am prepared to issue the permit for S-4002. If I have them by early afternoon on Monday, June 23rd, I can bring the permitted plans and specifications to the June 24th meeting. I'm willing to replace the corrected section of the spec into the previously submitted specs if that is easier. Emailing them to me would be fine.

Thanks,

Daryl J. Gotham, P.E.

SECTION 02513

STEEL PIPE WATER MAIN

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. Steel pipe and fittings.

2. Pressure Testing water main.

3. The pipe specified under this section is to be minimum 48-inches in diameter.

B. Related Sections:

1. Section 02055 - Soils

2. Section 02060 - Aggregate

3. Section 02324 - Trenching

4. Section 02518 - Thrust Restraints

5. Section 02519 - Buried Valves

6. Section 02633 - Valve Vaults, Manholes, Frames and Covers

1.2 REFERENCES

A. ASTM International, (ASTM):

1. ASTM D1557 - Standard Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 Ft - Lbf/Ft3 (2,700 Kn-M/M3).

2. ASTM A139 - Standard Specification for Electric-Fusion (Arc) -Welded Steel Pipe (NPS 4 and Over).

3. ASTM A36 - Carbon Structural Steel, Specification For.

4. ASTM A283 - Low and Intermediate Tensile Strength Carbon Steel Plates, Specification For.

5. ASTM A572 - Standard Specification for High Strength, Low-Alloy Columbium Structural Steels.

6. ASTM E709 - Magnetic Particle Examination, Guide For.

B. American Society of Mechanical Engineers, (ASME):

1. ASME Section V - Nondestructive Testing.

2. ASME Section IX - Welding and Brazing Qualification.

C. American Welding Society, (AWS):

1. AWS B2.1 - Standard for Welding Procedure And Welding Qualifications.

1. AWWA C150 - Thickness Design of Ductile Iron Pipe.

2. AWWA C151 - Ductile Iron Pipe Centrifugally Cast.

3. AWWA C200 - Steel Water Pipe - 6 In. (150 mm) and Larger.

4. AWWA C205 - Cement-Mortar Protective Lining and Coating for Steel Water Pipe - 4 In. (100 mm) and Larger - Shop Applied.

5. AWWA C206 - Field Welding of Steel Water Pipe.

6. AWWA C207 - Steel Pipe Flanges for Waterworks Service - Sizes 4 In. Through 144 In.

7. AWWA C208 - Dimensions for Fabricated Steel Water Pipe Fittings.

8. AWWA C209 - Cold-Applied Tape Coatings for the Exterior of Special Sections, Connections, and Fittings for Steel Water Pipelines.

9. AWWA C210 - Liquid Epoxy Coating Systems for the Interior and Exterior of Steel Water Pipes.

10. AWWA C214 - Tape Coatings Systems for the Exterior of Steel Water Pipelines.

11. AWWA C216 - Heating-Shrinkable Cross-Linked Polyolefin Coatings for the Exterior of Special Sections, Connections, and Fittings for Steel Water Pipelines.

12. AWWA C218 - Coating the Exterior of Aboveground Steel Water Pipelines and Fittings.

13. AWWA C222 - Polyurethane Coatings for the Interior and Exterior of Steel Water Pipe and Fittings.

14. AWWA - Manual M11 - Steel Pipe a Guide for Design and Installation.

15. AWWA C602 - Cement Mortar Lining of Water Pipelines In Place – 4 in. and larger.

1.3 SUBMITTALS

A. Section 01330 - Submittal Procedures: Requirements for submittals.

B. Shop Drawings: Submit drawings showing pipe size, fitting size and location, valve location and joint details.

C. Product Data: Submit catalog data showing pipe sizes, and manufacturing standards. Design calculations for internal pressure, vacuum and external load conditions for non-restrained and restrained joints. Tabulate laying schedules corresponding to the serial numbers and/or identification numbers to be painted on the pipes, specials and fittings. Quality assurance test procedures, test reports for pipes, specials and fittings (as specified under Quality Assurance Tests). Quality control test reports for each production run of pipe, including production welds, welding operator tests and mill test reports of all steel plates, sheets and other materials used. Manufacturer's installation guide. Affidavits of compliance with the Contract Specifications - Certificate of Design. The affidavits shall include:

1. Pipes, specials and fittings (AWWA C200).

2. Cement-mortar protective lining (AWWA C205 and AWWA C602).

3. Tape coating for the exterior (AWWA C214 and AWWA C209).

4. Shrink wrap for exterior (AWWA C216).

5. Paint system for the exterior (AWWA C210, C218 or C222). The affidavits of compliance shall be signed by an authorized professional.

6. Bonding Straps.

7. Manufacturer's standard repair procedures.

8. Manufacturer's written quality control procedures.

D. Manufacturer's Installation Instructions: Indicate special installation requirements.

E. Manufacturer's Certificate: Certify that Products meet or exceed specified requirements.

1.4 CLOSEOUT SUBMITTALS

A. Section 01700 - Execution Requirements: Closeout procedures.

B. Manufacturer's field reports.

C. Project record documents:

1. Accurately record actual locations of piping mains, valves, connections, and invert elevations.

2. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

3. Provide a final record laying schedule.

1.5 QUALITY ASSURANCE

A. Perform Work in accordance with the basic provisions of AWWA C200 and M11, and the County Drain Commissioner's and other governing agencies.

B. Manufacturer Qualifications: Company specializing in manufacturing the Products specified in this section with minimum five years documented experience with the pipe diameters, lining and coatings to be utilized. The pipe manufacturer and the plant shall be ISO 9000 or SPFA certified.

C. Verification:

1. Inspections: All pipe shall be subject to inspection at the place of manufacture in accordance with the provisions of ANSI/AWWA C200 and ANSI/AWWA coating and lining standard as supplemented by the requirements herein.

2. Tests: Except as modified herein, all materials used in the manufacture of the pipe shall be tested in accordance with the requirements of ANSI/AWWA C200 and ANSI/AWWA coating and lining standards.

3. CONTRACTOR shall perform said material tests at no additional cost to OWNER. ENGINEER shall have the right to witness all testing conducted by CONTRACTOR.

4. Welding Requirements: All welding procedures used to fabricate pipe shall be qualified under the provision of ANSI/AWS B2.1 or ASME Sec. IX. Welding procedures shall be required for, but not limited to, longitudinal and girth or spiral welds for pipe cylinders, spigot and bell ring attachments, reinforcing plates and ring flange attachments, and plates/ring lug attachments.

5. Welder Qualifications: All welding shall be done by skilled welders, welding operators, and tackers who have had adequate experience in the methods, positions and materials to be used. Welders shall maintain current qualifications under the provisions of ANSI/AWSB2.1 or ASME Sec. IX. Machines and electrodes similar to those in the WORK shall be used in qualification tests. CONTRACTOR shall furnish all material and bear the expense of qualifying welders.

1.6 REGULATORY REQUIREMENTS

A. Recommended Standards for Water Works as Published by the Great Lakes, Upper Mississippi River Board of the Public Health and Environmental Managers (Ten States Standards).

1.7 DELIVERY, STORAGE, AND HANDLING

A. Section 01600 - Product Requirements: Provisions for the delivery, storage, protection and handling of products to and at site.

B. Accept pipe on site. Inspect for damage and inventory.

C. Pipe and fittings shall be handled by padded slings or the manufacturer's approved devices which will not damage the pipe exterior coating or mortar lining.

D. Rolling or sliding of pipe shall be prohibited under all circumstances and regardless of provisions made to protect pipe. Any pipe dropped shall be inspected by ENGINEER and repaired by CONTRACTOR or manufacturer to the satisfaction of ENGINEER, or if necessary, returned to the manufacturer's plant.

E. Provide stulls for shipping when required by manufacturer's recommendations.

F. Provide padded bolsters on trucks or rail cars to spread load and provide uniform support.

G. All pipe and fittings damaged in shipment or by handling at the job site prior to placement shall be inspected by ENGINEER and repaired by CONTRACTOR or manufacturer using manufacturer approved material and procedures to the satisfaction of ENGINEER, or if necessary, returned to the fabrication plant for approved repairs.

H. The pipe shall be strung along the route of the pipeline to the satisfaction of ENGINEER and shall be protected by the CONTRACTOR with proper lights, barricades, etc.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Steel Pipe.

1. OWNER Supplied Pipe

2. CONTRACTOR Supplied Pipe

a) American Cast Iron Pipe Co.

b) Northwest Pipe Company

c) Section 01600 - Product Requirements: Product options and substitutions. Substitutions: OWNER approved substitutions permitted.

2.2 STEEL PIPE AND FITTINGS

A. Pipe: Spiral welded with wall thickness in accordance with AWWA Manual M11.

1. All fabricated material shall be supplied and made by the pipe manufacturer.

2. Pipe, fittings and specials shall be marked as to mark number, date of manufacture, type with head classification and/or depth of bury in conformance and corresponding with approved laying schedule.

3. Pipe to meet all requirements of AWWA C200.

4. Steel for all fabricated pipe, specials and fittings shall conform to latest edition of ASTM A572 Grade 50 A139 Grade E or A139 Grade C unless otherwise specified. Maximum tensile stress under combined design minimum internal pressure plus water hammer or surge of a minimum of 100 psi shall not exceed 75% of the minimum specified yield strength of the material for all buried and unburied pipe, specials, and fittings based on the working pressure plus surge pressure.

5. Unless otherwise specified, the minimum steel cylinder thickness of cement lined pipe shall meet or exceed the requirements of AWWA C205.

6. OWNER Supplied Pipe:

a. Minimum pressures and thicknesses shall be as indicated below for the 66-inch and 60-inch steel pipe that is OWNER supplied. The working pressure for any pipe or appurtenances connected to these steel pipelines shall have a minimum pressure capable of withstanding the working pressure plus the surge pressure.

66-Inch Pipe			
Contract #	**Maximum Working Pressure**	**Additional Surge Pressure Allowance**	**Minimum 66" Wall Thickness With 52 ksi Steel**
S.4001	243 psi	121 psi	0.317"
S.4002	225 psi	113 psi	0.294"
S.4003	225 psi	113 psi	0.294"
S.4004	225 psi	113 psi	0.294"

60-Inch Pipe			
Contract #	**Maximum Working Pressure**	**Additional Surge Pressure Allowance**	**Minimum 66" Wall Thickness with 52 ksi Steel**
S.4004	247 psi	124 psi	0.294"
S.4005	247 psi	124 psi	0.294"
S.4006	247 psi	124 psi	0.294"

7. CONTRACTOR Supplied Pipe:

   a. The minimum working pressure ratings for CONTRACTOR supplied pipe are listed below based on the anticipated maximum pressure based upon surge modeling of the system.

Contract #	Maximum Working Pressure	Additional Surge Pressure Allowance
S.4001	250 psi	100 psi
S.4002	250 psi	100 psi
S.4003	200 psi	100 psi
S.4004	150 psi	100 psi
S.4005	150 psi	100 psi
S.4006	150 psi	100 psi

   b. Minimum thicknesses shall be adjusted based on the Grade of steel used. Pipe thickness shall be adjusted as needed if higher pressure ratings are indicated on the Contract Drawings. However, in no case shall the pipe pressure ratings be less than indicated above for any pipe associated with each particular contract.

8. It should be noted that the pipe OD shall be considered during manufacture such that CONTRACTOR supplied pipe can be properly connected to OWNER supplied pipe.

9. Design buried steel pipe, fittings and specials to withstand a collapse vacuum pressure of 14.7 psi. Design with trench soil compacted to 95% of maximum density per ASTM D1557 and a minimum factor of safety of 2.0 based on actual external loading (4 foot minimum) plus vacuum of 14.7 psi. Proper credit may be given to the cement mortar lining. Provide calculations to verify this.

   Design unburied steel pipe, fittings, and specials to withstand a collapse vacuum pressure of 14.7 psi with a minimum factor of safety of 1.5 without credit to the cement mortar lining. The wall thickness may be calculated using AWWA M11 Steel Pipe - A Guide for Design and Installation, Equations 4-4.

10. Design pipe for cover conditions as shown on the plans with a minimum of 4 feet of cover, at 120 lbs per cubic foot soil weight in accordance with AWWA M11. Modulus of soil reaction (E') of 1000 lbs per square inch to be used for design with a wide trench width and with one AASHTO HS20 truck.

11. The maximum allowable standard pipe deflection (out of round) shall be 3.0 percent, of the pipe inside diameter.

12. The wall thickness shall be increased, as required, at all bends, fittings, and anchorage locations where thrust is transmitted by the pipe, or for special applications or conditions. Pipe to be installed inside a tunnel casing shall be designed for full cover, including both live load and vacuum pressure.

13. Pipe is to be furnished principally in fifty (50) foot net laying lengths with special lengths, field-trim pieces, and closure pieces as required by plan and profile for location of elbows, tees, reducers, and other in line fittings. The pipe fabricator shall prepare a pipe laying schedule showing the location of each piece by mark number with station and invert elevation at each bell end.

    All steel pipe, specials and fittings shall be designed in accordance with the above specified design internal pressure (working pressure and surge pressure), design stress, external loading, vacuum conditions, materials and minimum wall thickness.

B. Fittings: Constructed of same material as pipe and shall be in accordance with AWWA C208 and M11.

C. Joints: The standard joint shall be an approved bell and spigot type suitable for lap welding of the joint or Flex-Ring boltless connection at the valves.

D. Adaptors: The manufacturer shall supply an insulated adapter where the pipeline is connected to any other existing or proposed pipeline where called out on the Contract Documents.

E. Electrical Continuity: Provide electrical continuity in the form of metallic bonds between each pipe or fitting joint that is not a welded joint using jumper wires. This applies to all valves or other push-on joints.

1. Provide at least two bonds between the steel cylinders of all adjacent pipe sections.

2. Bond length: Sufficient slack to allow for a total joint displacement of 2 inches.

3. Bonds: Either insulated No. 4 AWG cable or steel rod welded to adjacent cylinders.

    a. If insulated copper cable is used, coat all bare copper and steel at the connection with a dielectric.

F. Corrosion Control Test Stations:

1. Corrosion control test stations shall generally be post mount type above grade; however, flush mount type may be used when called on the Contract Drawings or approved by OWNER in special situations. Test stations shall consist of test wires and a terminal box of suitable type and size to allow access for testing. When approved by OWNER in unusual situations, flush

mount test stations shall be allowed. Terminal boxes shall have a lockable, removable cover and shall be designed suitable for installation in road rights-of way.

2. In areas susceptible to flooding or standing water, a water tight terminal box shall be provided. The box shall be designed to maintain the electrical terminals in a dry environment if the test station is completely submerged.

3. Acceptable terminal boxes are Fink manufactured by Cott Manufacturing Co. or OWNER approved substitute and shall be submitted with details for review and approval.

4. Along the water main route corrosion test stations shall be installed at locations and intervals indicated on the Contract Drawings.

5. The following wires shall be attached to the water transmission main and metallic casing pipes.

   a. One No. 12 AWG solid copper wire with TW or THW insulation.

   b. One No. 8 AWG stranded copper cable with high molecular weight polyethylene (HMWPE) insulation.

   c. Both wires shall terminate in the terminal box.

2.3 OWNERWELDED JOINTS FOR STEEL PIPE

A. Factory Welded Joints

1. All welds shall be sound and free from embedded scale or slag, have tensile strength across the weld not less than that of the thinner of the connected sections, and be watertight. Butt welds shall be used for all welded joints in the fabrication of bends and specials. Fillet welds shall be used for flange attachment in accordance with AWWA C207.

2. A yield point determination of a welded joint shall be made by an independent or manufacturer's certified testing laboratory at the beginning of the Work. All costs for laboratory testing shall be paid for by CONTRACTOR. Submit test report to ENGINEER.

B. Field Welded Joints

1. Field welded joints to conform to AWWA C206.

2. All welders and welding procedures used to install pipe shall be qualified under provisions of AWWA C206 and AWS D1.1.

3. Interior welds shall be done after joint shrink-wrap and trench backfill has been completed. Care shall be taken to prevent damage to the interior cement lining as well as the exterior shrink-wrap joint material and the polyurethane exterior coating.

4. Where exterior welds are performed adequate space must be provided for welding and inspection of joints.

5. All welded pipe joints shall have a minimum of two passes. The first pass for sealing the joint shall be a continuous seal weld around the joint.

a. Unless double fillet welds are specified, field welded lap joints and butt straps shall be fillet welded from the inside or outside of the pipe for pipe larger than 30-inches diameter and from the outside of the pipe for pipe 30-inches diameter and smaller.

b. Butt straps, where used or required, shall be minimum of 12-inches wide, same thickness and as pipe wall and provide for a minimum of 2-inches lap at each pipe joint.

6. All welds to be visually inspected and be acceptable for the following criteria:

a. Weld to have no cracks.

b. Thorough fusion shall exist between adjoining layers of weld metal.

c. All craters shall be filled to the full cross section of the weld.

d. Weld profiles to be in conformance with AWS.D1.1.

e. A fillet weld in single continuous weld is permitted to underrun the nominal fillet size specified by 1/16-inch provided that the undersize portion for the weld does not exceed 10 percent of the length of the weld.

f. Undercut to be no more than 0.01 inches deep.

g. Frequency of piping porosity in weld shall not exceed one in 4-inches of weld length and maximum diameter shall not exceed 3/32 inches.

h. In addition to a visual inspection test (VT), all fillet welds for lap joints must be tested using magnetic particle testing (MT) equipment in accordance with acceptance criteria stated in AWS D1.1.

C. Field Welding Report

1. Welding reports for each field welded joint shall be submitted to ENGINEER on a daily basis.

2. Welding report shall include

a. Weld joint station number

b. Date of weld

c. Welder's name and signature

d. Actual weld size at four quadrants of pipe and total number of weld passes.

e. Photographs identified by joint station and/or pipe mark numbers for all joints.

D. Field Applied Shrink Wrap, Photographs and Report

1. Each pipe joint shall have a manufacturer provided heat-shrinkable sleeve applied in accordance with ANSI/AWWS C216 and the manufacturer's recommendations.

2. Each pipe joint receiving field applied shrink wrap shall be photographed by CONTRACTOR and submitted to ENGINEER in a report. The report shall be organized in a manner approved by ENGINEER and OWNER and clearly show the details of the completed joint.

3. CONTRACTOR shall mark the date that shrink wrap was completed and the initials of the foreman next to the factory painted pipeline station number and also showing at least one pipe mark. Lettering size to be the same as used for the pipe stationing number.

2.4 COATINGS AND LININGS

A. Polyurethane Exterior Coating: (All buried pipe, fittings and specials)

1. Manufacturer factory applied polyurethane exterior coating shall meet or exceed the requirements of AWWA C222.

2. Coating Repair:

a. Coating repair shall be done in accordance with the pipe manufacturer's recommendations using repair materials approved by the pipe manufacturer. Repair options include: Repair Patch; Melt Stick; Epoxy Primer and Mastic Filler. All repairs shall be done in the presence of and to the satisfaction of ENGINEER.

b. Coating repair locations shall be documented by photograph, before repair, and after repair and shall include the stationing along the pipe as well as the pipe mark.

3. Holiday Test

a. Prior to shipment, the pipe shall be given an electrical holiday test using manufacturer approved testing equipment that provides audio detection of holidays. Prior to placement, the pipe shall be visually inspected for damage to the coating. Any areas that appear damaged shall be given an electrical holiday test using manufacturer approved testing equipment that provides audio detection of holidays. If the tests indicated no holidays and no visible damage is observed, no repairs are required.

b. When the damaged area shows a holiday when tested, repairs to the area shall be made in accordance with the procedure described above. The repaired area shall then be holiday tested to determine it is satisfactory.

B. Cement Mortar Lining per AWWA C205

1. Cement Mortar Lining of Steel Pipe:

a. Except as otherwise provided in AWWA Standard C205, interior surfaces of all steel pipe, fittings and specials shall be cleaned and lined in the shop with cement mortar lining applied centrifugally in conformity with AWWA Standard C205.

1) The lining machines: Types that have been used successfully for similar work and must be accepted by the Resident ENGINEER or his designated representative.

2) Take every precaution to prevent damage to the lining.

3) If lining is damaged or found faulty at the delivery site, replace the damage, or unsatisfactory portions with lining conforming to these Specifications.

b. Leave ends bare where field joints occur as shown on the Plans.

1) Leave ends of the linings square and uniform.

2) Feathered or uneven edges will not be permitted.

c. Remove defective linings, as identified in AWWA C205, from the pipe wall and replace to the full thickness required.

1) Cut back defective linings to a square shoulder in order to avoid feather-edged joints.

d. Keep cement-mortar lining moist during storage and shipping.

2. Fittings: Line fittings per AWWA C205.

3. Joint Coating and Pointing:

a. For pipe diameters 22 inches and larger: After the pipe zone bedding and backfill have been densified to at least one (1) foot above the top of the pipe, the inside joint recess of pipe 22 inches in diameter and larger shall first be moistened, then filled and pointed with a stiff cement mortar consisting of one part cement to two parts of sand, by weight. The finished joint shall be smooth and flush with the adjacent pipe surfaces. Interior joint pointing operations shall not be conducted within two joints of pipe laying operations.

4. Joint Coating Report

a. Photographs of each joint identified by joint station and/or pipe mark numbers shall be supplied by CONTRACTOR to ENGINEER for all joints installed. This documentation may be combined with other joint documentation.

2.5 BEDDING AND BACKFILL MATERIALS

A. Bedding Material:

1. Fill type as specified in Section 02060 - Aggregate, and the Contract Drawings.

B. Backfill Material:

1. Fill type for granular backfill and for soil backfill as required and as specified in Section 02055 - Soils, Section 02060 - Aggregate, and the Contract Drawings.

2.6 PIPE MATERIAL TESTS

A. In accordance with AWWA C200 and C208.

2.7 CASING PIPE

A. Use steel casing pipe conforming to MDOT Standards or other appropriate governing body. The casing pipe shall be continuous either by one pipe fabrication or by field welded joints in accordance with AWWA C206. Unless otherwise listed, casing pipe shall have a minimum yield strength of 35,000 psi.

B. Install casing pipe in the size and thickness according to the Contract Documents.

PART 3 EXECUTION

3.1 EXAMINATION

A. CONTRACTOR shall be responsible for coordinating shipment of OWNER Supplied Material directly with the Supplier, which shall be established and determined at the initial Project Meeting. If Bidder/CONTRACTOR requires any change to the delivery dates and times agreed upon at the initial Project Meeting, it shall give Supplier at least three (3) days' notice.

B. Section 01300 - Administrative Requirements: Coordination and project conditions.

C. Verify that trench cut is ready to receive work and excavation, dimensions, and elevations are as indicated on Drawings.

3.2 PREPARATION

A. Hand trim excavations to required elevations.

1. Correct over excavation with bedding material and compact to 95 percent of maximum density as specified in ASTM D1557.

B. Remove large stones or other hard matter that could damage pipe or impede consistent backfilling or compaction.

3.3 BEDDING

A. Excavate pipe trench in accordance with Section 02324.

B. Place bedding material in layers as specified in Section 02324.

3.4 INSTALLATION - PIPE

A. General:

1. Use proper and suitable tools and appliances for safe and convenient handling and laying pipes and fittings.

2. Make joints and install pipe and fittings in accordance with the instructions of the pipe manufacturer and AWWA Manual M11.

3. Examine all pieces for defects before installing in the ground and discard defective pieces.

4. The CONTRACTOR shall have on hand a sufficient supply of assorted short pipe lengths, adaptors, and any other fittings necessary to prevent delays in pipe laying.

5. Clean the interior of pipes and fittings before laying and keep clean until the completed work is ready for acceptance.

6. Lay pressure pipe to line and grade in the trench only after the trench has been dewatered and the foundation and bedding has been prepared in accordance with Section 02324.

    a. Mud, silt gravel, and other foreign material shall be kept out of the pipe and off the jointing surface.

7. All welding materials and procedures shall conform to ANSI/AWS D1.1, D1.3, and ANSI/ASME Boiler and Pressure Vessel Code, Section IX; AWWA C206, Field Welding of Steel Water Pipe; and applicable State Labor Regulations.

8. Install corrosion protection coating at joints and other repair locations, per manufacturers' instructions.

9. It should be noted that the Modulus of soil reaction (E') of 1000 lbs per square inch to be used for design of the pipe and trench. Care should be taken to assure that the trench preparation, backfill, bedding and compaction are performed in accordance with the specifications to achieve this support. Failure to achieve an E' of 1000 psi will be observed during the deflection testing.

B. Pipe Laying:

1. Lay pipe in a straight line unless shown otherwise indicated or approved by ENGINEER.

2. Maximum pipe joint deflection, if permitted, in accordance with the pipe manufacturers recommendations.

3. Long radius curves, either horizontal or vertical, may be laid with standard pipe by deflections at the joints.

4. Where field conditions require deflection of curves not anticipated by the Drawings, ENGINEER will determine the methods to be used.

    a. No additional payment will be made for laying pipe on curves as shown, or for field changes involving standard lengths of pipe deflected at the joints.

    b. When fittings not shown are required to meet field conditions, additional payment will not be made for fittings.

5. When pipe is laid on a curve, use fittings to obtain the curved alignment.

6. Inspect each pipe and fitting before lowering the buried pipe or fitting into the trench.

    a. Inspect the interior and exterior protective coatings.

    b. Patch damaged areas in the field with material similar to the original.

    c. Clean the ends of the pipe thoroughly.

    d. Remove foreign matter and dirt from inside of the pipe and keep it clean during and after laying.

    e. Handle pipe in a manner to avoid any damage to the pipe.

f. Do not drop or roll pipe into trenches under any circumstances.

7. Connections to Existing Water Mains:

a. Make connections to mains in use where shown.

b. Provide the fittings required to make the connections.

c. Where the connection of new work to old requires interruption of service and notification of customers affected, arrange with the superintendent of the utility and ENGINEER for a mutually agreed upon time to perform the work.

8. Project Termination:

a. Where the water main terminates, for any segment of this project, provide all necessary restraint and fittings and connect to the existing water main. If no existing water main is available, install a plug, with all necessary restraint and fittings, as a temporary cap. See Section 02518 for thrust blocking and restraint.

C. Installation in bored casing pipe:

1. Support pipelines, installed in casing, throughout their length with casing spacers or wood skids.

a. Spacers:

1) 12-inch wide 304 stainless steel spacers, minimum of2" wide glass reinforced plastic runners, PVC liner, and stainless steel bolts and lock nuts.

2) Place casing spacers at intervals per manufacturers' recommendations, with a maximum distance of 10-feet on center with a minimum of three (3) spacers per pipe length, with one (1) spacer within two (2) feet from any end and with ENGINEER's approval.

b. Skids:

1) Material

a) Seasoned western red cedar with the dimensions necessary to achieve the required pipe grade.

b) Pressure treated lumber with an approved preservative and dimensions necessary to achieve the required pipe grade.

c) Oak with dimensions necessary to achieve the required pipe grade.

2) Fasten skids to the pipe with hot dipped galvanized steel strapping or stainless steel strapping.

2. End treatment of the casing: In accordance with Contract Drawings, or if nothing is listed on the Drawings, the end shall be bulkheaded with 8-inch watertight masonry bulkhead.

3. Casing Fill: In accordance with Contract Drawings, or if nothing is listed on the Drawings, the casing shall be filled with peastone or granular fill.

3.5 WATER MAIN AND SEWER SEPARATION

A. Horizontal Separation:

1. Lay water mains at least ten (10) feet horizontally from any existing or proposed drain, storm sewer, sanitary sewer, combined sewer or sewer service connection per requirements of the Michigan Department of Environmental Quality.

2. Water mains may be laid closer than ten (10) feet form a sewer line when:

a. Local conditions prevent a lateral separation of the (10) feet.

b. The water main invert is at least 18-inches above the crown of the sewer; and

c. The water main is either in a separate trench or in the same trench on an undisturbed earth shelf located to one side of the sewer.

3. Both the water main and drain or sewer shall be constructed of slip-on or mechanical joint cast or ductile iron pressure pipe or PVC pipe meeting the requirements of Michigan Department of Environmental Quality when it is impossible to meet (1) or (2) above. The drain or sewer shall be pressure tested to the maximum expected surcharge head before backfilling.

B. Vertical Separation:

1. Lay water main so that its invert is 18-inches above the crown of the drain or sewer, or as shown on the Contract Drawings, whenever water mains cross storm or sanitary sewers or sewer service connections.

a. Maintain the vertical separation for that portion of the water main located within 10 feet horizontally of any sewer or drain crossed.

b. Center a length of water main pipe over the sewer to be crossed with joints equidistant from the sewer or drain.

2. Both the water main and sewer shall be constructed of slip-on or mechanical joint cast iron or ductile iron pipe or PVC pipe meeting the requirements of the requirements of Michigan Department of Environmental Quality when:

a. It is impossible to obtain the proper vertical separation as described in (1) above, or:

b. The water main passes under a sewer or drain.

3. Maintain vertical separation of 18-inches between the invert of the sewer or drain and the crown of the water main where a water main crosses under a sewer.

4. Support the sewer or drain lines to prevent settling and breaking the water main.

5. Extend construction on each side of the crossing until the normal distance from the water main to the sewer or drain is at least 10 feet.

3.6 PIPE ADJUSTMENTS

A. Sewer Service Pipes Adjusted:

1. Adjust only those sewer service pipe that lie within the cross-sectional area to be occupied by the new water main and only when approved in writing by ENGINEER.

2. Replacement pipe: ductile iron, per AWWA C150 and C151 Class 52 minimum, with push-on joints.

3. Make connection to existing pipe with flexible band seal type connectors.

B. Water Service Pipes Adjusted:

1. Adjust water service pipes which lie within the cross-sectional area to be occupied by the new water main per Contract Documents and when approved in writing by ENGINEER.

3.7 APPURTENANCES

A. Valves: See Section 02519 - Buried Valves.

B. Hydrants: See section 02081 - Hydrants.

C. Valve Basins: See Section 02633 - Storm Drainage Manholes, Frames and Covers.

D. Catch Basins or Storm Water Inlets Replaced:

1. General:

a. Remove and reconstruct all storm water inlets or catch basins interfering with the construction of the water main as indicated on the Contract Drawings and per ENGINEER.

2. Remove castings carefully, store and reuse.

a. The size and shape of the reconstructed item: Same as that removed.

b. Materials and workmanship: As specified for valve basins in Section 02633.

c. Reconnect connecting lead to the main sewer with ASTM C-14 Extra Strength pipe, with O-rings and push-on joints.

E. Sewer Replacement:

1. General:

a. Remove and replace sewer as indicated on the Contract Drawings and per ENGINEER.

b. Replace sewer with material specified.

F. Corrugated Metal Culvert Pipe Replacement:

1. General:

a. Remove and replace culvert pipe as indicated on the Contract Drawings and per ENGINEER.

b. Replace with material specified.

3.8 TESTING AND INSPECTION REPORTS

A. General:

1. After the joint configuration is complete, each length of pipe, as well as each fitting, special and appurtenance shall be shop tested to a pressure which will induce a hoop stress equal to at least 75% of the yield stress of the steel. Daily certified reports of hydrostatic tests shall be submitted to ENGINEER on a weekly basis. All quality control tests conducted by the manufacturer for each production run of pipe shall be submitted to ENGINEER on a weekly basis.

2. Welding Reports for each field welded joint shall be submitted to ENGINEER on a daily basis. The Welding Report shall include: weld joint station number based on the record drawings; date of weld; welder's name and signature; and actual weld size at four quadrants of pipe and total number of weld passes.

3. When a section of pipe and appurtenances has been completed and bedding materials is in place, provide the appliances, facilities, and water required for performing the specified pressure and leakage tests, as well as deflection testing.

4. After testing is complete drain the pipeline without injury to the work or surrounding area.

5. CONTRACTOR will be required to fully uncover a total of ten (10) joints, selected at random by ENGINEER, so that ENGINEER can visually inspect joints after welding from the pipe interior to verify integrity of welding and joint coating. Additional joints may be required to be uncovered, without limit, if problems are observed at the uncovered joints.

6. In addition to a visual inspection test (VT), all fillet welds for lap joints must be tested using magnetic particle testing (MT) equipment in accordance with acceptance criteria stated in AWS D1.1.

B. Pressure Test:

1. Subject all newly laid pipe or any valved sections of it to a hydrostatic pressure equal to the pipe pressure as indicated on the Contract Drawings.

a. Test Duration: 2 hours minimum, 6 hours maximum.

b. Slowly fill each section with potable water.

c. Expel all air from the pipe by means of taps at the highest elevations.

d. Plug the taps.

e. Remove and replace any cracked or defective pipe discovered during test.

f. The test pressure must hold for the duration of the test.

g. Repeat the pressure test until satisfactory.

h. Provide pipe manufacturer's test plugs or proper size and number, of adequate thickness with proper ribbing and stiffening for test pressures specified.

i. Pressure testing may be done in conjunction with the leakage testing.

C. Leakage Test:

1. After completion of the pressure test, conduct a leakage test to determine the quantity of water lost under the specified leakage test pressure.

a. Leakage test pressure is the maximum operating pressure of the section under test and is based on the elevation of the test gauge.

b. Duration of each leakage test: Minimum of 2 hours in addition to the pressure test period.

2. Allowable leakage in gal/hr for pipelines: Not greater than that determined as follows:

Allowable Leakage (Gal/Hr) = (J X D X Sqrt (P)) / 7400

Where:

J is the total Number of flanged, gasket, or push-on joints in tested length (excluding welded joints).

D is the Pipe diameter in inches.

P is the Average test pressure in psig.

Sqrt is the Square root operator.

3. Leakage is defined as the quantity of water supplied in the newly laid pipe or any valved section under test that is necessary to maintain the specified leakage test pressure after the pipe has been filled with potable or raw water and the air expelled.

4. All visible leaks are to be repaired regardless of the amount of leakage.

5. When leakage testing is performed against closed sectioning valves, the test shall be performed on each side of the valves independently.

6. Leakage testing may be done concurrently with the pressure testing.

D. Deflection Testing and Report:

1. After completion of construction and backfilling, prior to pressure and leakage testing, deflection testing is required for each pipe segment.

a. Maximum allowable internal deflection is 3 percent (pipe out of round).

b. A deflection testing report is required for each pipe section identified by the corresponding pipe section listed in the approved lay schedule or according to the record drawings.

c. Failure to pass the deflection testing will require reworking of the pipe bedding, backfill and compaction at no cost to OWNER. Severe violations, as determined solely by ENGINEER/OWNER shall require removal and replacement of the unsatisfactory piping at no cost to OWNER.

E. Weld Testing Report:

1. After completion of welding, prior to pressure and leakage testing, an inspection report of each field weld, for both the inside and the outside of the pipe at the weld, is required where any field welding has occurred (restrained joints, access manholes, etc.)

a. The location of the weld is to be indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings.

b. The report shall have the information for both the inside and the outside of each particular weld coordinated such that they both are located together in the report.

c. A photograph of each weld location is to be included in the report with the date, and location indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings.

F. Exterior Joint Protection or Pipe Repair Report:

1. After completion of shrink wrapping each welded joint or exterior pipe repair, prior to backfilling, an exterior inspection report of each joint protection and repair is required.

a. The location of the joint (or repair area) is to be indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings.

b. A photograph of each joint or repair location is to be included in the report with the date, and location indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings.

G. Grout Inspection Report:

1. After completion of construction, backfilling and welding, and the appropriate reports and test and prior to pressure and leakage testing, a report of the grout inspection is required for any field grouting that has been done and where any field welding has occurred (restrained joints, access manholes, etc.).

a. A grout inspection report is required for each location where grout was installed in the field. The location of the grout work is to be indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings.

b. A photograph of each grout repair is to be included in the report with the date, and location indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings

3.9 FLUSHING

A. Prior to flushing, all lines shall be broom swept to remove welding slag, construction dirt and debris.

B. Flush all lines to remove any debris or sediment. Flushing of each construction contract can be coordinated with all of the other construction contracts to better utilize water from Lake Huron, however, the timing and coordination of this activity is the responsibility of CONTRACTOR. OWNER and/or authorized representatives will be available to assist with this coordination as appropriate. Note that this flushing activity may delay final completion. Appropriate discharge permits shall be obtained to dispose of the water used during flushing.

GCDC WTP
Project Design Report
MDEQ Comments
11/24/2014

1. The WTP will be designed as two 15-MGD treatment trains. Are the unit processes inter-connected between each treatment train? Also, additional supply can be provided from storage for a limited timeframe. Please quantify "limited timeframe". Overview – Page 1
   Yes the two-15 mgd treatment trains will be interconnected at the following locations: 1) upstream of the rapid mix tanks; 2) upstream of the filters; and 3) upstream of the finished water reservoir. During average day flow conditions, an additional 5 days of an average day of water supply can be provided by utilizing existing storage within the GCDC distribution system.

2. The discussion in Sec. 2.1- Page 2 (Raw Water Storage Sizing Factors) should be simplified following our most recent discussion.
   The section on raw water sizing factors has been modified and is attached as a memorandum entitled Raw Water Reservoir Storage Reservoir – GCDC-WWS Water Treatment Plant, dated September 23, 2014.

3. GCDC should plan for an additional 125 MGAL of raw water storage for Phase 2 Storage (2025-2045). Also, 125 MGAL of additional storage (Proposed Phase 2 Storage) is discussed in the updated Raw Water Reservoir Storage report dated October 20, 2014.
   Following the recent purchase of properties adjacent to the WTP site, GCDC now has space to construct an additional 125 MG raw water impoundment south of the proposed 125 MG raw water impoundment in the future.

4. Sec 3.1 Part 1 mentions that space will be provided in the raw water pump room for two VFDs for two of the four GCDC WTP low lift pumps. Are two VFDs going to be provided at this time or is the space provision for future VFDs?
   Two VFD's will be initially be provided for each set of pumps, and while no additional VFD are anticipated in the future, there is available space to accommodate two future VFD's.

5. The hydraulic capacity of both GCDC pumps and all four of Flint's pumps in operation (Sec 3.1 Page 4) will not equate to the sum of the individual pump capacities. What is the maximum raw water pumping capacity (GCDC WTP and supply to Flint) based upon the individual pump curves and discharge piping.
   We realize that the capacity per pump drops off due to increasing frictional losses as more than one pump operate in parallel. System curves have been developed that take account of the static head conditions for the pumps,

friction loss in the piping, and minor losses associated with valves and fittings. The preliminary system curves are attached for the GCDC pumps and Flint pumps. The rated capacity for the pumps is determined based on system head at the maximum design flow rates, and based on three pumps operating in parallel for the maximum flow condition. The design maximum pumping capacity is 45-MGD for the GCDC raw water pumps, and 18-MGD for the Flint raw water pumps.

6. Is there a drop-dead date for Lapeer to commit to KWA? Will the low-lift station be constructed with the capability to add pumps for Lapeer at a future date? Sec. 3.1 (3) Page 4
   A drop-dead date has come and passed for Lapeer to join KWA. However, the pump room will be constructed with the capability to potentially add pumps for Lapeer at a future date.

7. We are assuming that access for cleaning the passive intake screens will be provided, please confirm. Will a spare Y w. screen be provided for redundancy? Sec. 3.2 Page 5
   The screens are fully submerged cylindrical screens, so there is no access to the screens. Cleaning of the screens will be accomplished using a Hydroburst™ compressed air system of the type provided by Johnson Screen. A PowerPoint file providing some informational slides on the compressed air cleaning system is attached. Access to a screen is not required for cleaning, as compressed air piping extended to each screen conveys the air burst used for cleaning. There are no plans to provide a spare Y w. screen for redundancy. The impoundment has a bypass around it in case it has to be taken out of service.

8. What reservoir condition(s) provide the design capacity (65 MGD) for each 60-inch intake screen? Can this capacity be provided at the impoundment's lowest operating level? Also, will the design capacity meet the service area's future needs 66 MGD (GCDC - 45mgd, Flint - 18mgd, Lapeer - 3 mgd)?
   The proposed facilities are being designed based on the water level in the reservoir ranging between Elev. +827.0 and +837.0 under normal operating conditions, and as low as Elev.+810.0 under abnormal low water level conditions. The top of screen elevation will be Elev.+805.0. The screens require a water depth of 5-ft above and 5-ft below the horizontal centerline of the screen for full capacity operation. The design length of the screens will be increased slightly to provide a capacity of 66 MGD. It should be noted that KWA is only contracted for 60 MGD, but assuming an additional 10% for treatment loss, the total is 66 MGD.

9. The suction header has been increased to 66-inches in diameter. What is the sustained capacity of the suction header? What is the maximum anticipated entrance velocity into the intake pipe? Sec. 3.3 Page 5
   The sustained capacity of the 66" suction header is dependent on the head and flow capacity of the raw water pumps in relation to the frictional losses

associated with flow through the header, and on static head conditions for the system. The capacity of the header is also dependent on the net positive suction head (NPSH) requirements of the pumps in relation to the available NPSH. As stated in response to question #5, the rated capacities for the GCDC and Flint raw water pumps is determined based on calculations of static head and friction head loss in the piping system. The NPSH requirements of the pumps are being evaluated and the pumps will be adequately submerged in the pump cans to satisfy the required NPSH in the proposed pumping station design configuration. The velocity of flow in the 66" header will be about 4.3 fps at 66-MGD, which is within design guidelines. The intake screens are located at the entrance to the 66" intake pipe, and the screens are sized for 0.5 fps maximum slot velocity.

10. Why are single-stage mixed-flow pumps being selected for low-lift as opposed to turbine pumps? Is adequate net positive suction head available to utilize this type of pump? Sec. 3.3 Page 6
Because the operating head is too low for turbine pumps. Pumps are being selected that are capable of operating under the available NPSH conditions. The NPSH requirements for the mixed flow pumps under consideration are not substantially different as compared to vertical turbine pumps for the Flint raw water supply.

11. Gate style valves on the pump suction and discharge headers (low-lift) may be better suited for VFD controls. We also recommend a combination of hydraulically actuated cone valves and motor actuated check valves to provide additional operational redundancy in the event of a widespread power outage or a loss of pressure that would prevent proper operation of these valves. Sec. 3.4 Page 6
We do not understand why gate valves would be better suited for pump operation when using VFD controls on the pumps. If MDEQ prefers that gate valves be used for isolation valves at the pumps rather than butterfly valves, then we will incorporate gate valves into design of the proposed pump station. We do not support use of both hydraulically actuated cone valves and motor actuated check valves on pump discharge lines. This level of redundancy is unnecessary and would needlessly add to the construction cost of the facility. Our current design intent is to provide a multi-function pump check valve and motorized throttling valve in the raw water pump discharge lines. We are switching from the Checktronic valve by GA Industries to the Type GBZ valve by Adams. The check valve does not rely on electrical power to close, so therefore a redundant cone valve is unnecessary.

12. Surge control valves for each pump are discussed on Page 6; however, Figure 8 shows one surge control valve on the low-service discharge header to Flint. Please clarify. Also, the surge control valve on the Flint discharge header needs to be downstream of all four pumps. Is surge protection being provided for the discharge header to Lapeer?
Two types of valves will be used, surge relief valves and surge control valves. The valve described in MDEQ's comment as a surge control valve on the low-

service discharge header to Flint is actually a surge relief valve. It functions to relieve the build-up of high surge pressure in the discharge header to the low pressure suction header. This surge relief valve was shown only on the piping system for the Flint pumps because this system was initially thought to operate at the highest pressure and the system has a very long transmission main. These conditions would make the Flint pumping system more susceptible to hydraulic surges than the Genesee County raw water pumping system, where operating head is low and the length of the piping system is only a fraction as long as the Flint system. The combination valve mentioned on page 6 of the PDR performs a surge control function by slowly opening on pump start-up and slowly closing when a stop command is given for pump operation. The slow action minimizes (controls) the occurrence of surge pressure. The Type GBZ Adams valve also provides surge control by using an oil filled hydraulic cylinder and piston to cushion valve closure. Surge control valves (Type GBZ by Adams or Checktronic by GA Industries) will be used for all pumps in the station. The pump station layout allows for the installation of surge relief valves on the future Lapeer raw water pumps if it is determined in the future to be necessary.

13. Can the VFDs be used interchangeably within each set of low lift pumps? Sec. 3.6 Page 7

No, each set of four low lift pumps will have two dedicated VFD's. Due to the cost of a Kirk Key system, they will not be able to be used on each of the four pumps.

14. The chemical feed and storage rooms and pump rooms will share the same superstructure. The DEQ recommends that the gas chlorination feed and storage be housed in a separate building. Sec. 10 – Page 18; however, states that the chlorine feed and storage area will be housed in a separate building from the WTP. Please clarify. Sec. 4 – Page 7

The gas chlorination feed and storage rooms will be housed in a separate building, as shown on the preliminary site plan.

15. Does the proposed enclosure of the filter and pre-treatment area provide better temp/humidity control for other areas of the WTP as opposed to standard block or concrete construction? Page 8

Yes, the use of glass storefront walls separates the water treatment areas from the other areas of the facility. The glass storefront helps so that GCDC will only be heating the galleries and not losing the heat to the cold water in the basins. Also, the storefront allows the operator to see all of the clarifiers and filters, not just partially through viewing windows. The controls will be located outside the glass storefront areas to protect them from excess humidity.

16. The facilities WTP operators, described on Page 9, (lunch room and accessories) should be sized to allow for several days of continuous occupancy (during potential emergency conditions).
Agreed, this will be considered during final design.

17. Will temperature/humidity control be provided in the storage room(s) to protect as-built and operating records? Will humidity control be provided in the filter pipe gallery?
Yes, temperature and humidity control will be provided in the storage rooms. There is no filter pipe gallery with the central column type filters. The piping in the dry well section of the filters will be within the treatment area and thus will not be able to be subject to the temperature and humidity control. Any exposed piping in the remainder of the facility will be insulated for temperature and humidity protection.

18. Two raw water transmission mains from the raw water pumps to the head of the WTP are recommended.
We will take this recommendation under advisement during final design.

19. Given that 8 filters are provided, the 4-filter rule applies as stated in R 325.11006 (c); thus, the statement that total filter capacity will be less when filters are off-line for backwashing is incorrect. Sec. 8 – Page 12.
We acknowledge that since a total of 8 filters are being provided that the total filter capacity will not need to be reduced to account for backwashing under the "4-filter rule." The text in the PDR will be revised accordingly.

20. Loading rates in excess of 3.0 gpm/sqft may be approved after successful completion of an approved pilot test or full-scale piloting while the WTP is in operation. Page 12
Acknowledged. The text in the PDR will be revised accordingly.

21. The filter-influent piping is sized at 60-inches to account for future considerations (re-rating filters to 5 gpm/sqft). Will the velocity at lower flows (<10 mgd) cause problems with potential settling in the pipes? Page 11
The filter influent piping has been changed and is now four-42-inch diameter pipes, one for each of the clarifiers. At a flow rate of 7.5 mgd through each of the filter influent pipes (filter loading rate of 3 gpm/sf), the resultant velocity is approximately 1.2 fps. At a flow rate of 12.5 mgd through each of the filter influent pipes (filter loading rate of 5 gpm/sf), the resultant velocity is approximately 2.0 fps. These velocities are less than or equal to the recommended maximum velocity of filtered water of 2 fps, and expected to be high enough to avoid potential settling in the pipes.

22. The central column design must not establish a cross connection between filters in service and any that are down for maintenance or that are being backwashed. Pages 12 and 13
There is no cross-connection potential for these types of filters since there is always positive pressure from the in-service filters. We have enclosed additional information on these types of filters for your reference.

23. The filter underdrain system will incorporate air-scour as part of backwashing. Can the air compressor (sized at 4,500 cfm) accommodate more than one backwash simultaneously? Page 13
The filter system design is based on only one filter being able to be backwashed at any given time; therefore, the air compressor will accommodate backwash of only one filter. Backwash operations will be initiated by plant operators, and the filter cells will be interlocked to allow only one cell to be backwashed at a time.

24. Water supply to meet filter backwash needs: How will flow from the remaining in-service filters within the set be controlled? Can adequate pressure be provided for an effective backwash? Can flow from in-service filters outside the set be utilized for backwash – Example….backwash Filter No. 1 from Filters 5 thru 8? Page 13
The backwash rate from the remaining in-service filters will be controlled by the elevation of the outlet weirs relative to the wash-trough lip. If adequate backwash flow cannot be achieved, a supplemental backwash line will be provided that will be supplied from the high service discharge pipe header. There will be a dividing wall in the wet well with a sluice gate that is normally open so that backwash water can be utilized from the effluent from the other 7 filters under normal operating conditions.

25. Will the main filter effluent consist of a single combined filter effluent (CFE) or a multiple CFE? Page 14
The filter wet well will have a dividing wall with a sluice gate that is normally open, but can be closed to isolate either treatment train. The effluent channel will be continuous with combined filter effluent.

26. The preliminary design basis is established with the assumption that the Lake Huron source water will remain classified as Bin 1. Bin classification monitoring will be needed at the raw water reservoir. Configuration of the WTP and reservoir should be based on the water quality from the reservoir. Page 14
Acknowledged. The text in the PDR will be revised to mention that additional monitoring will be required at the raw water impoundment to maintain a Bin 1 Classification. If the water quality in the raw water impoundment is temporarily diminished, the plant will have the ability to bypass the impoundment and deliver raw water directly from the upstream KWA pump station.

27. We are assuming the potassium permanganate dosage of 1.0ppm (125 lbs/day of dry chem) is based on 15 MGD flow rate. Is the dry chem. 100% available KMNO4? How will the chemical be diluted for the feed system for dosage determination? Sec. 9.1 – Page 15

Yes, the potassium permanganate dosage is based on a 15 mgd flow rate. The dry chemical is available at a 97 percent concentration. The chemical will be diluted using process water and a volumetric feeder.

28. How long will one batch (PAC), based on slurry tank size, last? Page 15-16

Based upon preliminary calculations utilizing a hopper size of 5 cubic feet, at a plant flow rate of 15 mgd, each batch of PAC would last approximately 4.4 hours. The PAC feed system will not utilize a slurry tank.

29. The corrosion inhibitor dosage rate of 5ppm that equates to 83.5 lbs/mgal is not correct. The correct dosage at 5 ppm is 41.7 lbs/mgal. Based on the size of the GCDC's service area, optimal corrosion control will need to be established. Change with the Lead & Copper program requirements and demonstration of optimal corrosion control will be discussed further. Sec. 9.5 – Page 16.

At this point, the preliminary design calculations are conservative and are based on the maximum feed rates. During final design, we will review the calculations and downsize the chemical storage tanks, as appropriate. GCDC aspires to provide optimum corrosion control within the distribution system in accordance with the Lead and Copper Program requirements.

30. Is it more cost-effective for pH control by lime feed verses reduced coagulant efficiency without pH control? Page 17

GCDC intends to utilize coagulant to achieve optimal floc formation. The lime feed will be utilized on an as needed basis for pH control.

31. Jar test results must be completed and included in the basis of design for chemical feed (prior to the Act 399 permit). Sizing of storage for the various treatment chemicals (coagulant) at average day – max. month will be the design standard and determined by jar testing. Will the future treatment plant capacity (45 MGD) require a second storage tank or will the proposed storage tanks be sized to accommodate plant expansion? Will sufficient space be provided for additional bulk storage tanks? Page 17

GCDC acknowledges that jar tests will need to performed to determine optimal chemical feed rates. Based on engineering judgment, we believe the dosage rates assumed in the PDR are conservative and actual dosage rates will likely be less. In addition, chemical storage facilities have either been oversized to account for future storage needs, or additional space is available for future chemical storage.

32. Separate areas should be provided for the fluoride feed equipment and the chemical storage. Also, the assumed fluoride dosage (0.7 ppm) should be adjusted to account for the naturally occurring fluoride in the source water. Page 18
The fluoride storage and feed equipment is located within a dedicated room, separate from the other chemicals. Based on available water quality data, the concentration of naturally occurring fluoride is approximately 0.13 ppm. Therefore, a dosage at the plant of 0.57 ppm would result in 0.7 ppm of fluoride at the point of injection.

33. As we discussed in our previous meetings, the WTP (initially classified as a DF WTP) will not be re-classified as a conventional WTP. Acceptable full-scale piloting results could allow the WTP to be eligible for a higher treatment plant flow rating, while maintaining a DF designation. Sec. 11 – Page 19.
Acknowledged.

34. Two treated water clearwells (1.3 Mgal each) are proposed which will provide a total treated storage volume of 2.6 MGAL and provides an additional 1.0 log removal for Giardia as required for Direct Filtration. The hydraulic gradeline in Figure 4; however, shows working volume of the clearwells (difference between the HWL and LWL) of only 0.86 MGAL. Adequate CT must be achieved in the clearwells for 1.0 Log removal based on the low level conditions.
Based on the 10/30/14 memorandum that was discussed at our previous meeting (copy enclosed), both warm and cold operating conditions were evaluated for CT requirements and the worst case yielded an operating range in the reservoir of 15 feet down to approximately 10.5 feet water depth. The hydraulic grade line profile will be revised accordingly.

35. The finished water storage reservoir capacity of 2.6 MGAL limits the maximum rated capacity to 19 MGD based on the direct filtration designation to achieve 1.0 Log removal for giardia (assume 1.0 ppm CL2 under the worst case condition). A finished water reservoir sized at 4.0 MGAL will increase the WTP's rated capacity to 30 MGD yet maintain 1.0 Log removal for giardia under the worst case condition. Also, at 45 MGD, how much additional storage will be needed? Will a third tank be required? Sizing of the finished water reservoir is important and the WTP should be constructed either to allow for easy increase in finished water storage capacity or else provide sufficient finished water storage capacity initially. Pages 19-20
Based on the 10/30/14 memorandum, the finished water reservoir design was based on conservative assumptions made during preliminary engineering and an initial assumption that the plant would receive a 2.5-log

credit for removal of Giardia by conventional treatment. However, MDEQ recently indicated that the plant would instead be classified as direct filtration and only be granted a 2.0-log credit, which requires an additional 0.5 log-removal of Giardia. The results detailed in the memorandum indicate that upon taking a practical approach to calculating CT log-credits and utilizing the filters for additional CT time, corresponding reservoir volumes offset the additional log-removal requirements. The worst case condition indicates a reservoir capacity of 1.81 MG at a plant capacity of 30 mgd.

If the plant is ever expanded to 45 mgd, all conditions would need to be re-evaluated. For planning purposed, it is assumed that one additional cell would be added for a total reservoir capacity of approximately 3.9 MG. There will be provisions in place (e.g. blind flanges on piping) to accommodate this expansion.

36. A by-pass around the finished water storage reservoir will not be allowed if the reservoir is required to maintain minimum CT. Sec. 11 – Page 21
No bypass around the finished water reservoir will be provided. The text in the PDR will be revised accordingly.

37. How far east of Baxter & Potter is the existing 72-inch transmission main owned by Genesee County? Sec. 12 – Page 21
The tie-in point for the finished water transmission main will be on the existing 72-inch diameter transmission main owned by GCDC, on the west side of the Henderson Road and Potter Road intersection.

38. 48 hour filter run times are short. Sec. 13 – Page 21
Agreed. This is a conservative approach and we acknowledge the run times will like be considerably longer.

39. Are there provisions to de-water treatment plant residuals? How much time will be needed to dry out accumulated sludge and to clean out a pond? Also, two ponds will be provided, each to hold one-year volume of sludge. Does the volume, estimated at 205,000 cuft., take into account minimum usable depth (accumulated sludge plus in-coming sludge) and minimum required freeboard Sec. 13 – Page 21:
There are no provisions in place for dewatering the plant residuals. The backwash ponds will accumulate solids, be allowed to dry and then be dredged out. At this time it is unclear how long it will take to dry out the accumulated sludge. However based on knowledge of similar plant operations, it will likely take significantly longer than one year to fill one pond. The depth of the ponds include a freeboard of 3-feet. Also, there will be provisions for a future pond to be added if required.

40. If the supernatant is to be decanted to the local receiving stream as the preferred method of disposal, an NPDES discharge permit will need to be obtained prior to our Act 399 permit. Also, will there be any discharge from the lagoons to the groundwater? Part 2210 of the Groundwater Rules allows construction of the sludge lagoons as part of our Act 399 permit; however, details pertaining any intended groundwater discharge, installation of liner to inhibit infiltration, and the design parameters listed in Item #38 needs to be provided as part of our review and permit issuance.
We acknowledge that the a NPDES permit would need to be obtained if supernatant is decanted to a local receiving stream. However, the proposed operation is for the decanted water to be pumped to the raw water impoundment. Both the backwash ponds and raw water impoundment will be lined so discharge to groundwater is not anticipated. All applicable design parameters and details will be provided as part of our Act 399 Permit application.

41. If the supernatant is pumped back to the head of the WTP, the recycle flow rate 1200 gpm (1.7 MGD rate) must be less than 10% of the combined incoming raw water flow. How will the recycle flow be controlled at treatment rates less than 17.0 MGD? Page 22
The decant pumping will not be continuous; it will be a batch operation. The decant pump discharge will be metered in order to confirm that less than 10% of the combined incoming raw water flow is recycled. To confirm, the decant water will be discharged directly into the raw water impoundment.

42. Wireless Laptops/tablets w. protective cases should be provided to allow oversight of plant operations at all locations in the WTP. Page 22
Acknowledged. It is anticipated that laptops will be utilized for this function.

43. Process monitoring from the raw water pump station includes turbidity, pH, temp, etc….will redundant storage of this information be provided? Sec. 14 – Page 23
Electronic data logs will be utilized and saved onto servers that will be backed-up.

44. While dual electrical feeds meets the requirement for a redundant source of power, permanent stand-by power generation at the WTP is recommended in the event of a widespread/regional loss of electrical power. Page 23-24
Noted. A small generator will be provided for critical systems. In addition, GCDC maintains a fleet of portable generators, and provisions for

connections will be incorporated into the design.

45. Carrier water used for chemical feed application points prior to the finished water reservoir must have adequate cross connection protection. Page 25
Agreed. Anti-siphon and check valves will be utilized. All plumbing will meet code requirements.

46. An on-site holding tank may be used for commercial/industrial waste; however, the septic tank/field can only be used for domestic wastewater. Page 25
Commercial/industrial wastes will not be discharged to the septic field, and no holding tanks for commercial/industrial waste is anticipated at the plant site. However, adequately sized containment areas for the chemical rooms will be provided along with sprinkler systems where required to meet building code requirements. Dry sumps will be provided within each containment area to accommodate removal of chemical spills.

47. Page 26, Section 17 – Security; Second Paragraph, third sentence….. "Signals being transmitted to security system workstations at the central……facilities". Does "signals" mean…the actual video, alarm, etc.? Please clarify
Signals will include security alarm points and video feeds to the control room at the plant.

48. Page 28, Section 19 – 3rd bullet - Frost depth – minimum 3'-6" below finished grade. Should the minimum depth be 5' below finished grade?
The geotechnical report recommendation is to embed foundations a minimum of 42" below finished grade to protect from frost heave. This can be found on Page 28 of Somat's most current report dated May 7, 2014.

49. The April 2014 PDR includes a section for ventilation (Sec. 16.2) and mentions ventilation for the chemical feed and storage rooms. The ventilation section is not included in the October 2014 PDR. Sec. 16 – Mechanical Facilities
The mechanical facilities section of the PDR was rewritten and the ventilation subsection was combined with the heating and air conditioning subsection.

50. Figure 3 – The ability for the GCDC WTP to directly by-pass the low service pump station is not provided. This provision appears to be provided for the Flint WTP.
This figure will be revised. As planned, there will be a bypass around the impoundment and most flows will be able to be pumped directly from the

KWA Intermediate Pump Station around the impoundment and directly to Flint or to the raw water pumps in the water treatment plant.

Raw Water Reservoir Storage – GCDC-WWS Water Treatment Plant

September 23, 2014

Genesee County Water Treatment Plant – Raw Water Reservoir

The conceptual design for the Genesee County Water Treatment Plant is 30 MGD with two treatment trains of 15 MGD each, with future expansion to 45 MGD. (AECOM/Wade Trim April 2014 Preliminary Design Report) The preliminary estimate for the raw water receiving reservoir was 150 MG. There were discussions with MDEQ, staff and consultants regarding the origin of the 150 MG and it is unclear how the preliminary number of 150MG was arrived at. There were also discussions with staff, MDEQ and consultants regarding the number of days of storage that were required for the facility, the two primary numbers under discussion were 10 days and 14 days.

In a meeting with MDEQ on September 5, 2014 the Commissioner requested that the MDEQ review this issue and provide some guidance for the design of the raw water receiving reservoir. This meeting also included discussions regarding existing contracts for back-up supply and the weight that existing finished water storage should be given in determining the volume of raw water storage. On September 10, 2014 the MDEQ (Mike Prysby) indicated that 10 days of storage would be satisfactory, however they would like to see demand projections for the next 20 years to ensure that the raw water receiving reservoir was adequate for future demands.

Genesee County Water System Demands

The five year average of GCDC-WWS AAD is 12.57 MGD, however the 2013 AAD was 10.937. The peak monthly average in the last 5 years is 22.7 MGD and occurred in August 2012. The 2014 DWRF Project Plan includes demand information and projections from 2000 through 2030. The 2025 AAD is projected to be 12.49 MGD. (DWRF Table 1-3 attached). The 20 year water demands should be analyzed in 2015.

Projected GCDC 2015 to 2025 AAD raw water demand for Phase 1 reservoir sizing – 12.5 MGD

Raw Water Storage Sizing Factors

The following factors have been identified by staff, consultants, and MDEQ regarding the sizing of the raw water receiving reservoir.

- MDEQ - 10 days of storage at 12.5 MGD, the 2025 AAD. (125 MG)
- There are existing contracts for emergency water supply that equal approximately 6.0 MGD. These contracts should be reconfirmed and used for extended emergency back-up
- There is 43.5 MG of finished water storage in the existing system, plus 3.5 MG in the Grand Blanc pressure districts. Assuming ½ of this storage is available for emergency use this will provide additional extended emergency back-up.
- Operational requirements to handle diurnal fluctuation were estimated at 70 MGD and are included in the 125 MG, this will be reevaluated when the plant is in operation.
- Spare parts, pipe, and fittings should be in stock for the repair of any size pipe on supply line or any critical element at the pumping facilities in order to minimize downtime during a failure on the supply line or at the pumping facilities
- City of Flint – 18 MGD of water from reservoir but no emergency storage. In the event of an emergency the City will use its Flint River source.
- City of Lapeer Raw Water Storage – 4 MGD of water from the raw water reservoir but no emergency storage in raw water storage reservoir. City of Lapeer must develop its own raw water storage plan.
- Total AAD demand on the storage reservoir approximates: GCDC @ 12.5 MGD + City of Flint @ 18 MGD + City of Lapeer @ 1.5 MGD = 32 MGD
- Total Peak Day on storage reservoir based on historical demands for GCDC and contract limitations for City of Flint and City of Lapeer approximates: GCDC @ 23 MGD + City of Flint @ 18 MGD + City of Lapeer @ 4 MGD = 45 MGD

- Total Peak Day on storage reservoir based on plant max flow and contracts for City of Flint and City of Lapeer approximates: GCDC @ 30.0 MGD + Flint @ 18 MGD + Lapeer @ 4 MGD = 52 MGD

Genesee County Emergency Back-up Water Supply Contracts

- Genesee County currently has a contract with the City of Flint to provide 3.0 MGD of water in the event of an emergency. This contract should be confirmed with the City.
- Genesee County and Grand Blanc Township currently have an operating agreement that in the event of an emergency Grand Blanc will isolate from the GCDC-WWS system, turn on their back-up wells and provide water to the Grand Blanc Township, a portion of the City of Burton, and a portion of Mundy Township along Fenton Road. This demand is approximately 3.0 MGD. This agreement should be confirmed.

Genesee County Finished Water Storage

Genesee County has a number of ground storage and elevated storage tanks that provide fire protection, diurnal peaking, and peak day demand buffering. GCDC-WWS has existing storage of 43.5 MG with an additional 3.5 MG of storage in the Grand Blanc pressure district and an additional 500,000 gallons in the City of Burton. Table 1 below shows the characteristics of each tank. Assuming that one-half of the storage is available for emergency use, 21.75 MG would be available in the event of an emergency. Grand Blanc storage is not included as they would be isolated from the system in the event of an extended emergency.

Table 1

Facility	No. of Tks	GALS/Tk	Total Gallons	CF	Height	Diameter

*Grand Blanc						
**Burton						
Totals			47,000,000	4,572,193		

Other Considerations

Impacts such as ice at the intake, contamination at the intakes, or freighter damage to one of the intakes are difficult to quantify. The proposed alternative and existing system options would provide almost 37 days of storage in the event of an extended emergency.

Emergency Storage Calculations – 2025 Demands

1. Emergency raw water storage with water restrictions in place: 80% of projected AAD of 12.5 MGD = 10.0 MGD (125MG / 10.0 MGD = 12.5 days)
2. Emergency system storage with water restrictions in place: 21.75 MG / 10.0 MGD = 2.2 Days
3. Emergency backup contracts with City of Flint and Grand Blanc in place (6 MGD), emergency AAD reduced to 4.0 MGD: (125 MG / 4.0 MGD = 31.25 Days)
4. Finished water storage credit per No. 3: (21.75 MG /4.0 MGD = 5.4 days)
5. Extended emergency provisions total 36.7 days

Proposed Phase 1 Storage 125 MG 2015 - 2025

- Provides a reasonable approach that exceeds operational minimum of 70 MG and meets the MDEQ suggested raw storage of 10 days.
- Provides operational storage to meet both AAD and Peak Day fluctuations.
- Provides 36.7 days of storage in the event of extended emergency conditions.

Proposed Phase 2 Storage X MG 2025 -2045

Long range water demands for the GCDC-WWS system should be evaluated in 2015 and Phase 2 storage will be evaluated after the plant has been up and running for 12 months.

Memorandum

To	Mike Winegard	Page	1
CC	Ed Tharp, Angel Gebeau		
Subject	Genesee County WTP CT Calculations for Filters and Finished Water Reservoir		
From	Chad Laucamp		
Date	October 30, 2014		

The following is a summary of CT Calculations (attached) that were recently completed for the Genesee County Water Treatment Plant filters and finished water reservoir. These calculations are based on the GCDC water treatment plant receiving a 2.0-log credit from MDEQ for a direct filtration type plant, and also based on the filters and finished water reservoir both having a baffle factor of 0.7. In addition, the required reservoir volume calculations are based on having two filter backwash volumes (0.41 MG) and a minimum required equalization volume (0.21 MG), in addition to the required CT volumes.

Scenario 1 (Conservative Approach)

Assumptions:

- Plant flow of 30 mgd
- 7 of 8 filters in service (1 filter offline)
- Water temperature 0.5 degrees C (33 degrees F)
- Water pH of 8.2
- Chlorine residual of 1.2 mg/L maintained in reservoir (minimum residual req'd in GCDC distribution system)

Table 1 summarizes the findings for Scenario 1, and indicates that if a chlorine residual of 0.5 mg/L is maintained in the filters and a chlorine residual of 1.2 mg/L is maintained in the reservoir, the required reservoir volume is 3.40 MG. If the chlorine residual in the filters is raised to 1.0 mg/L, the required reservoir volume is 3.21 MG.

Table 1
Scenario 1: Conservative Approach - CT Overview

Parameter Description	Chlorine Dosage at Filter Inlet	
	0.5 mg/L	1.0 mg/L
CT Value in Filters	7.85 mg/L-min	15.7 mg/L-min
Log Inactivation of Giardia in Filters	0.078-log	0.14-log
Required Giardia Log-Removal for Disinfection in Reservoir*	0.922-log	0.86-log
Required CT Volume	1.80 MG	1.68 MG
Minimum Reservoir Volume	3.40 MG	3.21 MG

*3.0-log required – 2.0-credit (direct filtration) – log inactivation in filters

Since chlorine is more effective as temperatures increase and plant flows are expected to significantly vary seasonally, the following more realistic operating conditions were evaluated.

Scenario 2 (Cold Operating Conditions)

Assumptions:

- Plant flow of 12 mgd
- 6 filters in service (2 filters on standby and rotated into service)
- Water temperature 0.5 degrees C (33 degrees F)
- Water pH of 8.2
- Two chlorine residual conditions were evaluated for comparison:
    - 1.0 mg/L maintained in reservoir (boosted to 1.2 mg/L at reservoir outlet to provide required residual for GCDC distribution system)
    - Chlorine residual of 1.2 mg/L maintained in reservoir (minimum residual req'd in GCDC distribution system)

Table 2 summarizes the findings for Scenario 2 – Cold Operating Conditions. The results indicate that if a chlorine residual of 0.5 mg/L is maintained in the filters, a reservoir volume of 1.81 MG is required for a chlorine residual in the reservoir of 1.0 mg/L, and a reservoir volume of 1.65 MG is required for a chlorine residual in the reservoir of 1.2 mg/L. If the chlorine residual in the filters is boosted to 1.0 mg/L, a reservoir volume of 1.62 MG is required for a chlorine residual in the reservoir of 1.0 mg/L, and a reservoir volume of 1.48 MG is required for a chlorine residual in the reservoir of 1.2 mg/L. These results indicate a significant decrease in required reservoir storage volume over Scenario 1, which is driven by reduced water demands expected during cold weather months.

Table 2
Scenario 2: Cold Operating Conditions - CT Overview

Parameter Description	Chlorine Dosage at Filter Inlet	
	0.5 mg/L	1.0 mg/L
CT Value in Filters	16.8 mg/L-min	33.6 mg/L-min
Log Inactivation of Giardia in Filters	0.17-log	0.31-log
Required Giardia Log-Removal for Disinfection in Reservoir*	0.83-log	0.69-log
1.0 mg/L chlorine residual in reservoir		
Required CT Volume	0.76 MG	0.63 MG
Minimum Reservoir Volume	1.81 MG	1.62 MG
1.2 mg/L chlorine residual in reservoir		
Required CT Volume	0.65 MG	0.54 MG
Minimum Reservoir Volume	1.65 MG	1.48 MG

*3.0-log required – 2.0-credit (direct filtration) – log inactivation in filters

Scenario 3 (Warm Operating Conditions)

Assumptions:

- Plant flow of 30 mgd
- 7 of 8 filters in service (1 filter offline)
- Water temperature 15 degrees C (59 degrees F)
- Water pH of 8.2
- Two chlorine residual conditions were evaluated for comparison:

- 1.0 mg/L maintained in reservoir (boosted to 1.2 mg/L at reservoir outlet to provide required residual for GCDC distribution system)
- Chlorine residual of 1.2 mg/L maintained in reservoir (minimum residual req'd in GCDC distribution system)

The following table summarizes the findings for Scenario 3 – Warm Operating Conditions. The results indicate that if a chlorine residual of 0.5 mg/L is maintained in the filters, a reservoir volume of 1.62 MG is required for a chlorine residual in the reservoir of 1.0 mg/L, and a reservoir volume of 1.50 MG is required for a chlorine residual in the reservoir of 1.2 mg/L. If the chlorine residual in the filters is boosted to 1.0 mg/L, a reservoir volume of 1.40 MG is required for a chlorine residual in the reservoir of 1.0 mg/L, and a reservoir volume of 1.30 MG is required for a chlorine residual in the reservoir of 1.2 mg/L. These results indicate a decrease in required reservoir storage volume, even when compared to Scenario 2, which is driven by chlorine being more effective as temperatures increase.

Table 3
Scenario 3: Warm Operating Conditions - CT Overview

Parameter Description	Chlorine Dosage at Filter Inlet	
	0.5 mg/L	1.0 mg/L
CT Value in Filters	7.85 mg/L-min	15.7 mg/L-min
Log Inactivation of Giardia in Filters	0.22-log	0.40-log
Required Giardia Log-Removal for Disinfection in Reservoir*	0.78-log	0.60-log
1.0 mg/L chlorine residual in reservoir		
Required CT Volume	0.63 MG	0.49 MG
Minimum Reservoir Volume	1.62 MG	1.40 MG
1.2 mg/L chlorine residual in reservoir		
Required CT Volume	0.55 MG	0.42 MG
Minimum Reservoir Volume	1.50 MG	1.30 MG

*3.0-log required – 2.0-credit (direct filtration) – log inactivation in filters

Summary

The current finished water reservoir design indicates a size of approximately 2.6 MG, which is based on conservative assumptions made during preliminary engineering and an initial assumption that the plant would receive a 2.5-log credit for removal of Giardia by conventional treatment. However, MDEQ has recently indicated that the plant would instead be classified as direct filtration and only be granted a 2.0-log credit, which requires an additional 0.5 log-removal of Giardia. While additional log-removal signifies the need for a larger sized reservoir, the results detailed in this memorandum indicate that taking a more practical, less conservative approach to calculating CT log-credits utilizing the filters for additional CT time, corresponding reservoir volumes offset the additional log-removal requirements. While the current 2.6 MG reservoir size is larger than what is required by the analysis in this memorandum, we recommend that no changes to the reservoir size be considered until MDEQ reviews and approves the assumptions and approach that are detailed within.

Furthermore, having some excess reservoir capacity does provide the plant some flexibility with regards to chlorine dosage points and concentrations, as well as provide additional equalization storage that allows the plant the flexibility of operating at a lower water level during extreme conditions. Based on a worst case reservoir capacity of 1.81 MG required in Scenario 2, the 2.60 MG

reservoir would have an operating range from the maximum water level of 15 feet down to approximately 10.5 feet water depth. If the reservoir is maintained full during a Scenario 2 cold operating condition, the plant could achieve a maximum capacity of 24.6 mgd due to the excess volume available for CT, which is approximately twice the capacity that is expected to be typical for cold operating conditions.

Subject: Needs Survey Update

As of today, we have 21 of 63 surveys submitted to Cadmus which met the deadline to have 1/3 submitted by August 1st. These 21 surveys are in various stages of review. 5 have been uploaded, meaning they are ready for review and for any possible modifications if you disagree with Cadmus' determinations. It has been taking about a month from the time I submit them to Cadmus until the information has been uploaded, meaning the status of individual projects are available for your review. To access this information, log in to the website (www.dwneeds.com). Unless you changed it, your state email address should be your user ID and your password should be just your last name with the first letter capitalized. If you see a project that has not been accepted that you feel should be, call me to discuss before you spend a lot of time attempting to justify it. I may be able to assist or save you the effort.

Of the 42 remaining surveys, 7 have been reviewed by district staff and are awaiting my review prior to submitting them to Cadmus. They are **Lansing, Michigan American Waterworks Company, Mount Clemens, Northville Township, Plymouth Township, Riverview, and Waterford Township.** Some of these surveys have been discussed with district staff and are being further reviewed. I hope to have them all submitted to Cadmus by the end of the week unless I find significant problems.

Another 13 surveys have been submitted and distributed to district staff to verify projects, validate documentation, and supplement with additional projects for overlooked needs. These surveys are **Midland, Saginaw, Saginaw-Midland, YCUA, Monroe South County, Kalamazoo, Romulus, Macomb Township, St. Clair Shores, Algonac, Port Huron, South Haven, and Southeastern Oakland County Water Authority.**

If one of these is assigned to you and you don't have the questionnaire, please let me know ASAP.

6 more surveys are in my office waiting to be distributed to district staff. They are **St. Joseph, Mount Pleasant, Flint, Sterling Heights, Shelby Township and Woodhaven.** I plan to complete my initial review and distribute them to you by the end of this week as well, although it may be Friday before they get in the mail unless I decide not to review them first.

That leaves 16 surveys yet to be submitted by the system, not the least of which is **DETROIT**. Others include **Ann Arbor, Wyoming, Genesee County, East Lansing-Meridian, Warren, Dearborn, Flat Rock, Grosse Pointe Park, Marquette, Grand Ledge, Eaton Rapids, Williamston, Union Township, Brownstown Township, and Fort Gratiot Township.** I know many of you have been in contact with these systems and are continuing to pursue completed questionnaires. Please keep tabs on them and if necessary, consider scheduling a surveillance visit to collect the needs of these systems, preferably before September 30th, but no later than the month of October.

If any of this information sounds wrong to you, please contact me. As always, call if you have any questions or concerns.

Subject: FW: Needs Survey modifications
Attachments: MI DWINSA data as of 5-11-12.xlsx

We have until May 21st (one week from Monday) to submit our last modifications. Please note the address listed in the message immediately below this one that we should use to submit modifications by email next week because Druanne Cote will not be available to process ones sent to her address.

I have also attached a large file in excel that provides the updated status of all projects in Michigan. Some people find this format easier to sort and manipulate to identify the projects that may need possible modifications. If you have a lot of systems or a system with a lot of projects, you can cut and paste the data from your systems into a separate excel workbook and then sort on the comment code to see which projects may need attention. For instance, all projects with a code of 100 have been accepted unchanged and can be ignored. Projects that have a code of 308 were modified by Cadmus, but only to the extent that costs will be modeled instead of using the cost estimate provided, so no further action is needed. You will find the codes on the opening page of the needs survey website.

As I look through this spreadsheet next week, I may be contacting some of you to discuss possible responses for systems that have a lot of deleted projects and for which you have not indicated any response or marked "satisfied" on the tracking spreadsheet. If I decide to submit modifications independently, I will copy you.

Richard

Yeah, please send them to needssurveysubmittals@cadmusgroup.com. Copy me if you're worried about them.

I'll get you MI's data in about 20 minutes.

Subject: RE: DWINSA Status Report 5/11/2012

Linda,

Should we be sending modifications to someone other than Dru next week? I expect one final push from some of our district staff.

Richard

Subject: DWINSA Status Report 5/11/2012

Greetings DWINSA Workgroup – with only one more week left to submit mods for state systems, we thought you might like to have a more detailed status report. Attached is the standard report, and below is some more specific information about the survey status on a national level.

We are working very hard to get as many of the December vintage surveys uploaded as possible this week. As you can see, we've currently uploaded 98% of state systems, so we're very close.

A few of you have asked for a full "data dump" of the projects you've submitted to date. To those who have requested it, I'll get them out today and they will be current as of this morning.

Please be aware the our Mods Coordinator, Dru Prescott will be out next week, so if you have any questions on modifications submitted or the mods process, you can contact Amanda Ereth, Sandie Koenig, Michelle Lee or myself.

Thank you all, and have a great weekend.

Subject: Darrell Early Meeting on City of Flint - Darrell Happens to be in Lansing on October 29

Location: Mayor's Conference Room, 1st Fl. Municipal Center, 1101 S. Saginaw Street, Flint, MI.

Start: 10/29/2014 2:00:00 PM

End: 10/29/2014 5:15:00 PM

Show Time As: Tentative

Required Attendees: Wyant, Dan (DEQ); Shekter Smith, Liane (DEQ); Busch, Stephen (DEQ)

Status Update:

Meeting Notice Includes Travel Time to Flint

Darrell Early, EM for City of Flint will not be in Lansing on October 29 as originally planned but has asked that the Director come to Flint and he can meet at 10:00 on Wednesday, October 29.

Please plan to travel with the Director:

I will need Liane, Stephen
Mike P. (optional depending on Jury Duty)
Sygo (optional based on schedule)

Thank you.

Mary Beth

MBT's Notes:
Good Morning Mary Beth:

Wednesday morning would work best for me. I would also like to invite Director Wyatt to Flint. We could meet at 10:00 AM in the Mayor's Conference Room, 1st Fl. Municipal Center, 1101 S. Saginaw Street, Flint, MI.

I have a standing 9:00 AM conference call meeting that morning with Treasury, the Governor's office, and the Michigan State Police. That usually runs between 30 and 45 minutes. Please let me know if this works.

I appreciate the opportunity to meet with Director on this very crucial issue in the City of Flint. You can also call me direct at 810.237.2057. My cellphone number is PPI

Sincerely,

Error! Filename not specified.
Darnell Earley, ICMA-CM, MPA
Emergency Manager
Flint, MI

Subject: FW: Peas-ish caller

Mike and Steve,

Please see the email chain below. The SEMI WRD received a PEAS call potentially regarding the Flint water intake in Lake Huron. Kris Donaldson forwarded your contact information to me.

I was wondering if you have received notice today of any issues regarding the project. As you will see below, we have received a report of sheen in Lake Huron, potentially near the project area.

Could you either provide an update on the situation if you are informed, or provide contact information for a contractor or consultant associated with the project who may know more information?

Thank you in advance for your time. FYI, I attempted to reach you via phone, I will try again if I don't hear from you within the hour.

Regards,

Matt Goddard

Hey Kris,

Please see below, sounds like a possible PEAS report on the Flint water intake project in Lake Huron. I know this isn't your project, but are you able to provide a staff contact for me to talk so we can get a call into the contractor?

Thanks,

M. Goddard

Received a transferred call from the Lansing office. Caller, John Busch, lives in Birchville and is reporting a sheen of oil on the top of Lake Huron and is reporting that oil is coming up on the beach. Mentioned there is boring and large barges putting in some sort of line. I have not been able to reach anyone within our office for assistance with the caller, I did page when I was at the front and took this call. Can someone please contact him to receive further information? Also whomever responds, please notify everyone so all are aware that this has been taken care of.

Subject: RE: Peas-ish caller

All,

Please see the emails below regarding a PEAS report that may be originating from the City of Flint water intake project.

After further discussion and investigation, it appears that the Flint water intake project was permitted under Part 325 from the Saginaw Bay District Office and the drinking water portion of the project was reviewed by the Lansing District Office, with ownership of the intake belonging to city of Flint.

I have been asked by my supervisor to refer this issue to respective districts and associated staff.

Best Regards,

Subject: RE: Peas caller

Hello All,

I was in that general area today and did not notice any sheens on the water upshore or downshore of the pipeline –I was looking at the shoreline of 2 separate homes for High Risk Erosion compliance, and the water was clear everywhere I went.

Thanks,

Theresa

Matt,

At this point, I do not have any additional information pertaining to the oil sheen or PEAS incident. I tried to contact Genesee Co. staff who are directly involved with the project; however, they are out for remainder of the day. The KWA-Intake consultant is Rowe Professional Services – Mr. Jim Redding (810) 341-7500 I also contacted the Saginaw Bay office. They did not have a contact for the contractor info handy; however, they informed me that WRD has taken enforcement action against Worth Twp (which borders the shoreline – including the project site) for discharge violations from their WWTP. I will be meeting with Genesee County staff tomorrow morning and will ask if they are aware of this situation and will obtain consultant contact information. Mr. Charlie Bauer from WRD is the contact person for further information concerning the WWTP situation.

All,

Please see the emails below regarding a PEAS report that may be originating from the City of Flint water intake project.

After further discussion and investigation, it appears that the Flint water intake project was permitted under Part 325 from the Saginaw Bay District Office and the drinking water portion of the project was reviewed by the Lansing District Office, with ownership of the intake belonging to city of Flint.

I have been asked by my supervisor to refer this issue to respective districts and associated staff.

Mike and Steve,

Please see the email chain below. The SEMI WRD received a PEAS call potentially regarding the Flint water intake in Lake Huron. Kris Donaldson forwarded your contact information to me.

I was wondering if you have received notice today of any issues regarding the project. As you will see below, we have received a report of sheen in Lake Huron, potentially near the project area.

Could you either provide an update on the situation if you are informed, or provide contact information for a contractor or consultant associated with the project who may know more information?

Thank you in advance for your time. FYI, I attempted to reach you via phone, I will try again if I don't hear from you within the hour.

Regards,

Matt Goddard

Hey Kris,

Please see below, sounds like a possible PEAS report on the Flint water intake project in Lake Huron. I know this isn't your project, but are you able to provide a staff contact for me to talk so we can get a call into the contractor?

Thanks,

M. Goddard

All –

Received a transferred call from the Lansing office. Caller, John Busch, lives in Birchville and is reporting a sheen of oil on the top of Lake Huron and is reporting that oil is coming up on the beach. Mentioned there is boring and large barges putting in some sort of line. I have not been able to reach anyone within our office for assistance with the caller, I did page when I was at the front and took this call. Can someone please contact him to receive further information? Also whomever responds, please notify everyone so all are aware that this has been taken care of.

Subject: Intake Launch

I have an additional staff person who wishes to observe the launch of the intake; however, he has a late afternoon time constraint. Will the launch be promptly at 2pm or is does it include a public event (similar to the Flint WTP Switchover) with the actual launching following the event (1/2 to 1 hour later)? Our travel plans will need to be adjusted to accommodate a later launch time.

Subject: Pumpage reporting

Tim, Mark

Upon determining GCDC's yearly pumpage (ADD and MDD), we have three sources: GCDC's monthly report, Flint's monthly report, and GCDC's annual pumpage report. Unfortunately, none of these sources agree with one another. GCDC's MOR in most cases reports lower total purchased water…..the annual pumpage report is typically the highest, and the Flint MOR usually falls in between…. We have been using GCDC's annual pumpage report for determining ADD and MDD; however, we would like to verify that this is the correct source to use. It would also be worthwhile to investigate the reason for the discrepancy between each of the three sources.

GCDC WTP
Project Design Report
MDEQ Comments
11/14/2014

1. The WTP will be designed as two 15-MGD treatment trains. Are the unit processes inter-connected between each treatment train? Overview – Page 1

2. Is there a drop-dead date for Lapeer to commit to KWA? Will the low-lift station be constructed with the capability to add pumps for Lapeer at a future date? Sec. 3.1 (3) Page 4

3. We are assuming that access for cleaning the passive intake screens will be provided, please confirm. Will a spare Y w. screen be provided for redundancy? Sec. 3.2 Page 5

4. The suction header has been increased to 66-inches in diameter. What is the sustained capacity of the suction header? What is the maximum anticipated entrance velocity into the intake pipe? Sec. 3.3 Page 5

5. Why are single-stage mixed-flow pumps being selected for low-lift as opposed to turbine pumps? Sec. 3.3 Page 6

6. Gate style valves on the pump suction and discharge headers (low-lift) may be better suited for VFD controls. Sec. 3.4 Page 6

7. Surge control valves for each pump are discussed on Page 6; however, Figure 8 shows one surge control valve on the low-service discharge header to Flint. Please clarify. Also, the surge control valve on the Flint discharge header needs to be downstream of all four pumps. Is surge protection being provided for the discharge header to Lapeer?

8. Can the VFDs be used interchangeably within each set of low lift pumps? Sec. 3.6 Page 7

9. The chemical feed and storage rooms and pump rooms will share the same superstructure. The DEQ recommends that the gas chlorination feed and storage be housed in a separate building. Sec. 10 – Page 18; however, states that the chlorine feed and storage area will be housed in a separate building from the WTP. Please

clarify. Sec. 4 – Page 7

10. Given that 8 filters are provided, the 4-filter rule applies, ref. R 325.11006 (c).....The statement that total filter capacity will be less when filters are off-line for backwashing is incorrect. Sec. 8 – Page 12.

11. Loading rates in excess of 3.0 gpm/sqft will be approved after successful completion of an approved pilot test or full-scale piloting while the WTP is in operation. Page 12

12. The filter underdrain system will incorporate air-scour as part of backwashing. Can the air compressor (sized at 4,500 cfm) accommodate more than one backwash simultaneously? Page 13

13. Will the main filter effluent consist of a single combined filter effluent (CFE) or a multiple CFE? Page 14

14. We are assuming the potassium permanganate dosage of 1.0ppm (125 lbs/day of dry chem) is based on 15 MGD flow rate. Is the dry chem. 100% available KMNO4? Sec. 9.1 – Page 15

15. The dosage rate of 5ppm being 83.5 lbs/mgal needs to be changed to 41.7 lbs/mgal. Sec. 9.5 – Page 16.

16. As we discussed in our previous meetings, the WTP (initially classified as a DF WTP) will not be re-classified as a conventional WTP. Acceptable full-scale piloting results could allow the WTP to be eligible for a higher treatment plant rating; however, while maintaining a DF designation. Sec. 11 – Page 19.

17. Two treated water clearwells (1.3 Mgal each) are proposed which will provide a total treated storage volume of 2.6 MGAL and would provide an additional 1.0 log removal for Giardia as required for Direct Filtration. The hydraulic gradeline in Figure 4; however, shows working volume of the clearwells (difference between the HWL and LWL) of only 0.86 MGAL. Adequate CT must be achieved in the clearwells for 1.0 Log removal based on the actual operating conditions.

18. The finished water storage reservoir capacity of 2.6 MGAL limits the maximum rated capacity to 19 MGD based on the direct filtration designation to achieve 1.0 Log removal for giardia (assume 1.0 ppm

CL2 under the worst case condition). A finished water reservoir sized at 4.0 MGAL will increase the WTP's rated capacity to 30 MGD yet maintain 1.0 Log removal for giardia under the worst case condition.

19. How will CT be achieved if the finished water reservoirs are bypassed? Sec. 11 – Page 21

20. How far east of Baxter & Potter is the existing 72-inch transmission main owned by Genesee County? Sec. 12 – Page 21

21. 48 hour filter run times are short. Sec. 13 – Page 21

22. Are there provisions to de-water treatment plant residuals? Sec. 13 – Page 22:

23. Process monitoring from the raw water pump station includes turbidity, pH, temp, etc….will redundant storage of this information be provided? Sec. 14 – Page 23

24. The April 2014 PDR includes a section for ventilation (Sec. 16.2) and mentions ventilation for the chemical feed and storage rooms. The ventilation section is not included in the October 2014 PDR. Sec. 16 – Mechanical Facilities

GCDC WTP
Project Design Report
MDEQ Comments
11/24/2014

1. The WTP will be designed as two 15-MGD treatment trains. Are the unit processes inter-connected between each treatment train? Also, additional supply can be provided from storage for a limited timeframe. Please quantify "limited timeframe". Overview – Page 1
   Yes the two-15 mgd treatment trains will be interconnected at the following locations: 1) upstream of the rapid mix tanks; 2) upstream of the filters; and 3) upstream of the finished water reservoir. During average day flow conditions, an additional 5 days of an average day of water supply can be provided by utilizing existing storage within the GCDC distribution system.

2. The discussion in Sec. 2.1- Page 2 (Raw Water Storage Sizing Factors) should be simplified following our most recent discussion.
   The section on raw water sizing factors has been modified and is attached as a memorandum entitled Raw Water Reservoir Storage Reservoir – GCDC-WWS Water Treatment Plant, dated September 23, 2014.

3. GCDC should plan for an additional 125 MGAL of raw water storage for Phase 2 Storage (2025-2045). Also, 125 MGAL of additional storage (Proposed Phase 2 Storage) is discussed in the updated Raw Water Reservoir Storage report dated October 20, 2014.
   Following the recent purchase of properties adjacent to the WTP site, GCDC now has space to construct an additional 125 MG raw water impoundment south of the proposed 125 MG raw water impoundment in the future.

4. Sec 3.1 Part 1 mentions that space will be provided in the raw water pump room for two VFDs for two of the four GCDC WTP low lift pumps. Are two VFDs going to be provided at this time or is the space provision for future VFDs?
   Two VFD's will be initially be provided for each set of pumps, and while no additional VFD are anticipated in the future, there is available space to accommodate two future VFD's.

5. The hydraulic capacity of both GCDC pumps and all four of Flint's pumps in operation (Sec 3.1 Page 4) will not equate to the sum of the individual pump capacities. What is the maximum raw water pumping capacity (GCDC WTP and supply to Flint) based upon the individual pump curves and discharge piping.
   We realize that the capacity per pump drops off due to increasing frictional losses as more than one pump operate in parallel. System curves have been developed that take account of the static head conditions for the pumps,

friction loss in the piping, and minor losses associated with valves and fittings. The preliminary system curves are attached for the GCDC pumps and Flint pumps. The rated capacity for the pumps is determined based on system head at the maximum design flow rates, and based on three pumps operating in parallel for the maximum flow condition. The design maximum pumping capacity is 45-MGD for the GCDC raw water pumps, and 18-MGD for the Flint raw water pumps.

6. Is there a drop-dead date for Lapeer to commit to KWA? Will the low-lift station be constructed with the capability to add pumps for Lapeer at a future date? Sec. 3.1 (3) Page 4
   A drop-dead date has come and passed for Lapeer to join KWA. However, the pump room will be constructed with the capability to potentially add pumps for Lapeer at a future date.

7. We are assuming that access for cleaning the passive intake screens will be provided, please confirm. Will a spare Y w. screen be provided for redundancy? Sec. 3.2 Page 5
   The screens are fully submerged cylindrical screens, so there is no access to the screens. Cleaning of the screens will be accomplished using a Hydroburst™ compressed air system of the type provided by Johnson Screen. A PowerPoint file providing some informational slides on the compressed air cleaning system is attached. Access to a screen is not required for cleaning, as compressed air piping extended to each screen conveys the air burst used for cleaning. There are no plans to provide a spare Y w. screen for redundancy. The impoundment has a bypass around it in case it has to be taken out of service.

8. What reservoir condition(s) provide the design capacity (65 MGD) for each 60-inch intake screen? Can this capacity be provided at the impoundment's lowest operating level? Also, will the design capacity meet the service area's future needs 66 MGD (GCDC - 45mgd, Flint - 18mgd, Lapeer - 3 mgd)?
   The proposed facilities are being designed based on the water level in the reservoir ranging between Elev. +827.0 and +837.0 under normal operating conditions, and as low as Elev.+810.0 under abnormal low water level conditions. The top of screen elevation will be Elev.+805.0. The screens require a water depth of 5-ft above and 5-ft below the horizontal centerline of the screen for full capacity operation. The design length of the screens will be increased slightly to provide a capacity of 66 MGD. It should be noted that KWA is only contracted for 60 MGD, but assuming an additional 10% for treatment loss, the total is 66 MGD.

9. The suction header has been increased to 66-inches in diameter. What is the sustained capacity of the suction header? What is the maximum anticipated entrance velocity into the intake pipe? Sec. 3.3 Page 5
   The sustained capacity of the 66" suction header is dependent on the head and flow capacity of the raw water pumps in relation to the frictional losses

associated with flow through the header, and on static head conditions for the system. The capacity of the header is also dependent on the net positive suction head (NPSH) requirements of the pumps in relation to the available NPSH. As stated in response to question #5, the rated capacities for the GCDC and Flint raw water pumps is determined based on calculations of static head and friction head loss in the piping system. The NPSH requirements of the pumps are being evaluated and the pumps will be adequately submerged in the pump cans to satisfy the required NPSH in the proposed pumping station design configuration. The velocity of flow in the 66" header will be about 4.3 fps at 66-MGD, which is within design guidelines. The intake screens are located at the entrance to the 66" intake pipe, and the screens are sized for 0.5 fps maximum slot velocity.

10. Why are single-stage mixed-flow pumps being selected for low-lift as opposed to turbine pumps? Is adequate net positive suction head available to utilize this type of pump? Sec. 3.3 Page 6
Because the operating head is too low for turbine pumps. Pumps are being selected that are capable of operating under the available NPSH conditions. The NPSH requirements for the mixed flow pumps under consideration are not substantially different as compared to vertical turbine pumps for the Flint raw water supply.

11. Gate style valves on the pump suction and discharge headers (low-lift) may be better suited for VFD controls. We also recommend a combination of hydraulically actuated cone valves and motor actuated check valves to provide additional operational redundancy in the event of a widespread power outage or a loss of pressure that would prevent proper operation of these valves. Sec. 3.4 Page 6
We do not understand why gate valves would be better suited for pump operation when using VFD controls on the pumps. If MDEQ prefers that gate valves be used for isolation valves at the pumps rather than butterfly valves, then we will incorporate gate valves into design of the proposed pump station. We do not support use of both hydraulically actuated cone valves and motor actuated check valves on pump discharge lines. This level of redundancy is unnecessary and would needlessly add to the construction cost of the facility. Our current design intent is to provide a multi-function pump check valve and motorized throttling valve in the raw water pump discharge lines. We are switching from the Checktronic valve by GA Industries to the Type GBZ valve by Adams. The check valve does not rely on electrical power to close, so therefore a redundant cone valve is unnecessary.

12. Surge control valves for each pump are discussed on Page 6; however, Figure 8 shows one surge control valve on the low-service discharge header to Flint. Please clarify. Also, the surge control valve on the Flint discharge header needs to be downstream of all four pumps. Is surge protection being provided for the discharge header to Lapeer?
Two types of valves will be used, surge relief valves and surge control valves. The valve described in MDEQ's comment as a surge control valve on the low-

service discharge header to Flint is actually a surge relief valve. It functions to relieve the build-up of high surge pressure in the discharge header to the low pressure suction header. This surge relief valve was shown only on the piping system for the Flint pumps because this system was initially thought to operate at the highest pressure and the system has a very long transmission main. These conditions would make the Flint pumping system more susceptible to hydraulic surges than the Genesee County raw water pumping system, where operating head is low and the length of the piping system is only a fraction as long as the Flint system. The combination valve mentioned on page 6 of the PDR performs a surge control function by slowly opening on pump start-up and slowly closing when a stop command is given for pump operation. The slow action minimizes (controls) the occurrence of surge pressure. The Type GBZ Adams valve also provides surge control by using an oil filled hydraulic cylinder and piston to cushion valve closure. Surge control valves (Type GBZ by Adams or Checktronic by GA Industries) will be used for all pumps in the station. The pump station layout allows for the installation of surge relief valves on the future Lapeer raw water pumps if it is determined in the future to be necessary.

13. Can the VFDs be used interchangeably within each set of low lift pumps? Sec. 3.6 Page 7

No, each set of four low lift pumps will have two dedicated VFD's. Due to the cost of a Kirk Key system, they will not be able to be used on each of the four pumps.

14. The chemical feed and storage rooms and pump rooms will share the same superstructure. The DEQ recommends that the gas chlorination feed and storage be housed in a separate building. Sec. 10 – Page 18; however, states that the chlorine feed and storage area will be housed in a separate building from the WTP. Please clarify. Sec. 4 – Page 7

The gas chlorination feed and storage rooms will be housed in a separate building, as shown on the preliminary site plan.

15. Does the proposed enclosure of the filter and pre-treatment area provide better temp/humidity control for other areas of the WTP as opposed to standard block or concrete construction? Page 8

Yes, the use of glass storefront walls separates the water treatment areas from the other areas of the facility. The glass storefront helps so that GCDC will only be heating the galleries and not losing the heat to the cold water in the basins. Also, the storefront allows the operator to see all of the clarifiers and filters, not just partially through viewing windows. The controls will be located outside the glass storefront areas to protect them from excess humidity.

16. The facilities WTP operators, described on Page 9, (lunch room and accessories) should be sized to allow for several days of continuous occupancy (during potential emergency conditions).
Agreed, this will be considered during final design.

17. Will temperature/humidity control be provided in the storage room(s) to protect as-built and operating records? Will humidity control be provided in the filter pipe gallery?
Yes, temperature and humidity control will be provided in the storage rooms. There is no filter pipe gallery with the central column type filters. The piping in the dry well section of the filters will be within the treatment area and thus will not be able to be subject to the temperature and humidity control. Any exposed piping in the remainder of the facility will be insulated for temperature and humidity protection.

18. Two raw water transmission mains from the raw water pumps to the head of the WTP are recommended.
We will take this recommendation under advisement during final design.

19. Given that 8 filters are provided, the 4-filter rule applies as stated in R 325.11006 (c); thus, the statement that total filter capacity will be less when filters are off-line for backwashing is incorrect. Sec. 8 – Page 12.
We acknowledge that since a total of 8 filters are being provided that the total filter capacity will not need to be reduced to account for backwashing under the "4-filter rule." The text in the PDR will be revised accordingly.

20. Loading rates in excess of 3.0 gpm/sqft may be approved after successful completion of an approved pilot test or full-scale piloting while the WTP is in operation. Page 12
Acknowledged. The text in the PDR will be revised accordingly.

21. The filter-influent piping is sized at 60-inches to account for future considerations (re-rating filters to 5 gpm/sqft). Will the velocity at lower flows (<10 mgd) cause problems with potential settling in the pipes? Page 11
The filter influent piping has been changed and is now four-42-inch diameter pipes, one for each of the clarifiers. At a flow rate of 7.5 mgd through each of the filter influent pipes (filter loading rate of 3 gpm/sf), the resultant velocity is approximately 1.2 fps. At a flow rate of 12.5 mgd through each of the filter influent pipes (filter loading rate of 5 gpm/sf), the resultant velocity is approximately 2.0 fps. These velocities are less than or equal to the recommended maximum velocity of filtered water of 2 fps, and expected to be high enough to avoid potential settling in the pipes.

22. The central column design must not establish a cross connection between filters in service and any that are down for maintenance or that are being backwashed. Pages 12 and 13
There is no cross-connection potential for these types of filters since there is always positive pressure from the in-service filters. We have enclosed additional information on these types of filters for your reference.

23. The filter underdrain system will incorporate air-scour as part of backwashing. Can the air compressor (sized at 4,500 cfm) accommodate more than one backwash simultaneously? Page 13
The filter system design is based on only one filter being able to be backwashed at any given time; therefore, the air compressor will accommodate backwash of only one filter. Backwash operations will be initiated by plant operators, and the filter cells will be interlocked to allow only one cell to be backwashed at a time.

24. Water supply to meet filter backwash needs: How will flow from the remaining in-service filters within the set be controlled? Can adequate pressure be provided for an effective backwash? Can flow from in-service filters outside the set be utilized for backwash – Example….backwash Filter No. 1 from Filters 5 thru 8? Page 13
The backwash rate from the remaining in-service filters will be controlled by the elevation of the outlet weirs relative to the wash-trough lip. If adequate backwash flow cannot be achieved, a supplemental backwash line will be provided that will be supplied from the high service discharge pipe header. There will be a dividing wall in the wet well with a sluice gate that is normally open so that backwash water can be utilized from the effluent from the other 7 filters under normal operating conditions.

25. Will the main filter effluent consist of a single combined filter effluent (CFE) or a multiple CFE? Page 14
The filter wet well will have a dividing wall with a sluice gate that is normally open, but can be closed to isolate either treatment train. The effluent channel will be continuous with combined filter effluent.

26. The preliminary design basis is established with the assumption that the Lake Huron source water will remain classified as Bin 1. Bin classification monitoring will be needed at the raw water reservoir. Configuration of the WTP and reservoir should be based on the water quality from the reservoir. Page 14
Acknowledged. The text in the PDR will be revised to mention that additional monitoring will be required at the raw water impoundment to maintain a Bin 1 Classification. If the water quality in the raw water impoundment is temporarily diminished, the plant will have the ability to bypass the impoundment and deliver raw water directly from the upstream KWA pump station.

27. We are assuming the potassium permanganate dosage of 1.0ppm (125 lbs/day of dry chem) is based on 15 MGD flow rate. Is the dry chem. 100% available KMNO4? How will the chemical be diluted for the feed system for dosage determination? Sec. 9.1 – Page 15

Yes, the potassium permanganate dosage is based on a 15 mgd flow rate. The dry chemical is available at a 97 percent concentration. The chemical will be diluted using process water and a volumetric feeder.

28. How long will one batch (PAC), based on slurry tank size, last? Page 15-16

Based upon preliminary calculations utilizing a hopper size of 5 cubic feet, at a plant flow rate of 15 mgd, each batch of PAC would last approximately 4.4 hours. The PAC feed system will not utilize a slurry tank.

29. The corrosion inhibitor dosage rate of 5ppm that equates to 83.5 lbs/mgal is not correct. The correct dosage at 5 ppm is 41.7 lbs/mgal. Based on the size of the GCDC's service area, optimal corrosion control will need to be established. Change with the Lead & Copper program requirements and demonstration of optimal corrosion control will be discussed further. Sec. 9.5 – Page 16.

At this point, the preliminary design calculations are conservative and are based on the maximum feed rates. During final design, we will review the calculations and downsize the chemical storage tanks, as appropriate. GCDC aspires to provide optimum corrosion control within the distribution system in accordance with the Lead and Copper Program requirements.

30. Is it more cost-effective for pH control by lime feed verses reduced coagulant efficiency without pH control? Page 17

GCDC intends to utilize coagulant to achieve optimal floc formation. The lime feed will be utilized on an as needed basis for pH control.

31. Jar test results must be completed and included in the basis of design for chemical feed (prior to the Act 399 permit). Sizing of storage for the various treatment chemicals (coagulant) at average day – max. month will be the design standard and determined by jar testing. Will the future treatment plant capacity (45 MGD) require a second storage tank or will the proposed storage tanks be sized to accommodate plant expansion? Will sufficient space be provided for additional bulk storage tanks? Page 17

GCDC acknowledges that jar tests will need to performed to determine optimal chemical feed rates. Based on engineering judgment, we believe the dosage rates assumed in the PDR are conservative and actual dosage rates will likely be less. In addition, chemical storage facilities have either been oversized to account for future storage needs, or additional space is available for future chemical storage.

32. Separate areas should be provided for the fluoride feed equipment and the chemical storage. Also, the assumed fluoride dosage (0.7 ppm) should be adjusted to account for the naturally occurring fluoride in the source water. Page 18
The fluoride storage and feed equipment is located within a dedicated room, separate from the other chemicals. Based on available water quality data, the concentration of naturally occurring fluoride is approximately 0.13 ppm. Therefore, a dosage at the plant of 0.57 ppm would result in 0.7 ppm of fluoride at the point of injection.

33. As we discussed in our previous meetings, the WTP (initially classified as a DF WTP) will not be re-classified as a conventional WTP. Acceptable full-scale piloting results could allow the WTP to be eligible for a higher treatment plant flow rating, while maintaining a DF designation. Sec. 11 – Page 19.
Acknowledged.

34. Two treated water clearwells (1.3 Mgal each) are proposed which will provide a total treated storage volume of 2.6 MGAL and provides an additional 1.0 log removal for Giardia as required for Direct Filtration. The hydraulic gradeline in Figure 4; however, shows working volume of the clearwells (difference between the HWL and LWL) of only 0.86 MGAL. Adequate CT must be achieved in the clearwells for 1.0 Log removal based on the low level conditions.
Based on the 10/30/14 memorandum that was discussed at our previous meeting (copy enclosed), both warm and cold operating conditions were evaluated for CT requirements and the worst case yielded an operating range in the reservoir of 15 feet down to approximately 10.5 feet water depth. The hydraulic grade line profile will be revised accordingly.

35. The finished water storage reservoir capacity of 2.6 MGAL limits the maximum rated capacity to 19 MGD based on the direct filtration designation to achieve 1.0 Log removal for giardia (assume 1.0 ppm CL2 under the worst case condition). A finished water reservoir sized at 4.0 MGAL will increase the WTP's rated capacity to 30 MGD yet maintain 1.0 Log removal for giardia under the worst case condition. Also, at 45 MGD, how much additional storage will be needed? Will a third tank be required? Sizing of the finished water reservoir is important and the WTP should be constructed either to allow for easy increase in finished water storage capacity or else provide sufficient finished water storage capacity initially. Pages 19-20
Based on the 10/30/14 memorandum, the finished water reservoir design was based on conservative assumptions made during preliminary engineering and an initial assumption that the plant would receive a 2.5-log

credit for removal of Giardia by conventional treatment. However, MDEQ recently indicated that the plant would instead be classified as direct filtration and only be granted a 2.0-log credit, which requires an additional 0.5 log-removal of Giardia. The results detailed in the memorandum indicate that upon taking a practical approach to calculating CT log-credits and utilizing the filters for additional CT time, corresponding reservoir volumes offset the additional log-removal requirements. The worst case condition indicates a reservoir capacity of 1.81 MG at a plant capacity of 30 mgd.

If the plant is ever expanded to 45 mgd, all conditions would need to be re-evaluated. For planning purposed, it is assumed that one additional cell would be added for a total reservoir capacity of approximately 3.9 MG. There will be provisions in place (e.g. blind flanges on piping) to accommodate this expansion.

36. A by-pass around the finished water storage reservoir will not be allowed if the reservoir is required to maintain minimum CT. Sec. 11 – Page 21
No bypass around the finished water reservoir will be provided. The text in the PDR will be revised accordingly.

37. How far east of Baxter & Potter is the existing 72-inch transmission main owned by Genesee County? Sec. 12 – Page 21
The tie-in point for the finished water transmission main will be on the existing 72-inch diameter transmission main owned by GCDC, on the west side of the Henderson Road and Potter Road intersection.

38. 48 hour filter run times are short. Sec. 13 – Page 21
Agreed. This is a conservative approach and we acknowledge the run times will like be considerably longer.

39. Are there provisions to de-water treatment plant residuals? How much time will be needed to dry out accumulated sludge and to clean out a pond? Also, two ponds will be provided, each to hold one-year volume of sludge. Does the volume, estimated at 205,000 cuft., take into account minimum usable depth (accumulated sludge plus in-coming sludge) and minimum required freeboard Sec. 13 – Page 21:
There are no provisions in place for dewatering the plant residuals. The backwash ponds will accumulate solids, be allowed to dry and then be dredged out. At this time it is unclear how long it will take to dry out the accumulated sludge. However based on knowledge of similar plant operations, it will likely take significantly longer than one year to fill one pond. The depth of the ponds include a freeboard of 3-feet. Also, there will be provisions for a future pond to be added if required.

40. If the supernatant is to be decanted to the local receiving stream as the preferred method of disposal, an NPDES discharge permit will need to be obtained prior to our Act 399 permit. Also, will there be any discharge from the lagoons to the groundwater? Part 2210 of the Groundwater Rules allows construction of the sludge lagoons as part of our Act 399 permit; however, details pertaining any intended groundwater discharge, installation of liner to inhibit infiltration, and the design parameters listed in Item #38 needs to be provided as part of our review and permit issuance.
We acknowledge that the a NPDES permit would need to be obtained if supernatant is decanted to a local receiving stream. However, the proposed operation is for the decanted water to be pumped to the raw water impoundment. Both the backwash ponds and raw water impoundment will be lined so discharge to groundwater is not anticipated. All applicable design parameters and details will be provided as part of our Act 399 Permit application.

41. If the supernatant is pumped back to the head of the WTP, the recycle flow rate 1200 gpm (1.7 MGD rate) must be less than 10% of the combined incoming raw water flow. How will the recycle flow be controlled at treatment rates less than 17.0 MGD? Page 22
The decant pumping will not be continuous; it will be a batch operation. The decant pump discharge will be metered in order to confirm that less than 10% of the combined incoming raw water flow is recycled. To confirm, the decant water will be discharged directly into the raw water impoundment.

42. Wireless Laptops/tablets w. protective cases should be provided to allow oversight of plant operations at all locations in the WTP. Page 22
Acknowledged. It is anticipated that laptops will be utilized for this function.

43. Process monitoring from the raw water pump station includes turbidity, pH, temp, etc….will redundant storage of this information be provided? Sec. 14 – Page 23
Electronic data logs will be utilized and saved onto servers that will be backed-up.

44. While dual electrical feeds meets the requirement for a redundant source of power, permanent stand-by power generation at the WTP is recommended in the event of a widespread/regional loss of electrical power. Page 23-24
Noted. A small generator will be provided for critical systems. In addition, GCDC maintains a fleet of portable generators, and provisions for

connections will be incorporated into the design.

45. Carrier water used for chemical feed application points prior to the finished water reservoir must have adequate cross connection protection. Page 25
Agreed. Anti-siphon and check valves will be utilized. All plumbing will meet code requirements.

46. An on-site holding tank may be used for commercial/industrial waste; however, the septic tank/field can only be used for domestic wastewater. Page 25
Commercial/industrial wastes will not be discharged to the septic field, and no holding tanks for commercial/industrial waste is anticipated at the plant site. However, adequately sized containment areas for the chemical rooms will be provided along with sprinkler systems where required to meet building code requirements. Dry sumps will be provided within each containment area to accommodate removal of chemical spills.

47. Page 26, Section 17 – Security; Second Paragraph, third sentence….. "Signals being transmitted to security system workstations at the central……facilities". Does "signals" mean…the actual video, alarm, etc.? Please clarify
Signals will include security alarm points and video feeds to the control room at the plant.

48. Page 28, Section 19 – 3rd bullet - Frost depth – minimum 3'-6" below finished grade. Should the minimum depth be 5' below finished grade?
The geotechnical report recommendation is to embed foundations a minimum of 42" below finished grade to protect from frost heave. This can be found on Page 28 of Somat's most current report dated May 7, 2014.

49. The April 2014 PDR includes a section for ventilation (Sec. 16.2) and mentions ventilation for the chemical feed and storage rooms. The ventilation section is not included in the October 2014 PDR. Sec. 16 – Mechanical Facilities
The mechanical facilities section of the PDR was rewritten and the ventilation subsection was combined with the heating and air conditioning subsection.

50. Figure 3 – The ability for the GCDC WTP to directly by-pass the low service pump station is not provided. This provision appears to be provided for the Flint WTP.
This figure will be revised. As planned, there will be a bypass around the impoundment and most flows will be able to be pumped directly from the

KWA Intermediate Pump Station around the impoundment and directly to Flint or to the raw water pumps in the water treatment plant.

Raw Water Reservoir Storage – GCDC-WWS Water Treatment Plant

September 23, 2014

Genesee County Water Treatment Plant – Raw Water Reservoir

The conceptual design for the Genesee County Water Treatment Plant is 30 MGD with two treatment trains of 15 MGD each, with future expansion to 45 MGD. (AECOM/Wade Trim April 2014 Preliminary Design Report) The preliminary estimate for the raw water receiving reservoir was 150 MG. There were discussions with MDEQ, staff and consultants regarding the origin of the 150 MG and it is unclear how the preliminary number of 150MG was arrived at. There were also discussions with staff, MDEQ and consultants regarding the number of days of storage that were required for the facility, the two primary numbers under discussion were 10 days and 14 days.

In a meeting with MDEQ on September 5, 2014 the Commissioner requested that the MDEQ review this issue and provide some guidance for the design of the raw water receiving reservoir. This meeting also included discussions regarding existing contracts for back-up supply and the weight that existing finished water storage should be given in determining the volume of raw water storage. On September 10, 2014 the MDEQ (Mike Prysby) indicated that 10 days of storage would be satisfactory, however they would like to see demand projections for the next 20 years to ensure that the raw water receiving reservoir was adequate for future demands.

Genesee County Water System Demands

The five year average of GCDC-WWS AAD is 12.57 MGD, however the 2013 AAD was 10.937. The peak monthly average in the last 5 years is 22.7 MGD and occurred in August 2012. The 2014 DWRF Project Plan includes demand information and projections from 2000 through 2030. The 2025 AAD is projected to be 12.49 MGD. (DWRF Table 1-3 attached). The 20 year water demands should be analyzed in 2015.

Projected GCDC 2015 to 2025 AAD raw water demand for Phase 1 reservoir sizing – 12.5 MGD

Raw Water Storage Sizing Factors

The following factors have been identified by staff, consultants, and MDEQ regarding the sizing of the raw water receiving reservoir.

- MDEQ - 10 days of storage at 12.5 MGD, the 2025 AAD. (125 MG)
- There are existing contracts for emergency water supply that equal approximately 6.0 MGD. These contracts should be reconfirmed and used for extended emergency back-up
- There is 43.5 MG of finished water storage in the existing system, plus 3.5 MG in the Grand Blanc pressure districts. Assuming ½ of this storage is available for emergency use this will provide additional extended emergency back-up.
- Operational requirements to handle diurnal fluctuation were estimated at 70 MGD and are included in the 125 MG, this will be reevaluated when the plant is in operation.
- Spare parts, pipe, and fittings should be in stock for the repair of any size pipe on supply line or any critical element at the pumping facilities in order to minimize downtime during a failure on the supply line or at the pumping facilities
- City of Flint – 18 MGD of water from reservoir but no emergency storage. In the event of an emergency the City will use its Flint River source.
- City of Lapeer Raw Water Storage – 4 MGD of water from the raw water reservoir but no emergency storage in raw water storage reservoir. City of Lapeer must develop its own raw water storage plan.
- Total AAD demand on the storage reservoir approximates: GCDC @ 12.5 MGD + City of Flint @ 18 MGD + City of Lapeer @ 1.5 MGD = 32 MGD
- Total Peak Day on storage reservoir based on historical demands for GCDC and contract limitations for City of Flint and City of Lapeer approximates: GCDC @ 23 MGD + City of Flint @ 18 MGD + City of Lapeer @ 4 MGD = 45 MGD

- Total Peak Day on storage reservoir based on plant max flow and contracts for City of Flint and City of Lapeer approximates: GCDC @ 30.0 MGD + Flint @ 18 MGD + Lapeer @ 4 MGD = 52 MGD

Genesee County Emergency Back-up Water Supply Contracts

- Genesee County currently has a contract with the City of Flint to provide 3.0 MGD of water in the event of an emergency. This contract should be confirmed with the City.
- Genesee County and Grand Blanc Township currently have an operating agreement that in the event of an emergency Grand Blanc will isolate from the GCDC-WWS system, turn on their back-up wells and provide water to the Grand Blanc Township, a portion of the City of Burton, and a portion of Mundy Township along Fenton Road. This demand is approximately 3.0 MGD. This agreement should be confirmed.

Genesee County Finished Water Storage

Genesee County has a number of ground storage and elevated storage tanks that provide fire protection, diurnal peaking, and peak day demand buffering. GCDC-WWS has existing storage of 43.5 MG with an additional 3.5 MG of storage in the Grand Blanc pressure district and an additional 500,000 gallons in the City of Burton. Table 1 below shows the characteristics of each tank. Assuming that one-half of the storage is available for emergency use, 21.75 MG would be available in the event of an emergency. Grand Blanc storage is not included as they would be isolated from the system in the event of an extended emergency.

Table 1

Facility	No. of Tks	GALS/Tk	Total Gallons	CF	Height	Diameter
Henderson Rd	2	10,000,000	20,000,000	1,336,898	39	208.97
Clio Rd	1	1,000,000	1,000,000	133,690	40	65.25

Embury *	1	500,000	500,000	66,845	24	59.57
Bristol Tower **	1	500,000	500,000	66,845	37.5	47.65
*Grand Blanc						
**Burton						
Totals			47,000,000	4,572,193		

Other Considerations

Impacts such as ice at the intake, contamination at the intakes, or freighter damage to one of the intakes are difficult to quantify. The proposed alternative and existing system options would provide almost 37 days of storage in the event of an extended emergency.

Emergency Storage Calculations – 2025 Demands

1. Emergency raw water storage with water restrictions in place: 80% of projected AAD of 12.5 MGD = 10.0 MGD (125MG / 10.0 MGD = 12.5 days)
2. Emergency system storage with water restrictions in place: 21.75 MG / 10.0 MGD = 2.2 Days
3. Emergency backup contracts with City of Flint and Grand Blanc in place (6 MGD), emergency AAD reduced to 4.0 MGD: (125 MG / 4.0 MGD = 31.25 Days)
4. Finished water storage credit per No. 3: (21.75 MG /4.0 MGD = 5.4 days)
5. Extended emergency provisions total 36.7 days

Proposed Phase 1 Storage 125 MG 2015 - 2025

- Provides a reasonable approach that exceeds operational minimum of 70 MG and meets the MDEQ suggested raw storage of 10 days.
- Provides operational storage to meet both AAD and Peak Day fluctuations.
- Provides 36.7 days of storage in the event of extended emergency conditions.

Proposed Phase 2 Storage X MG 2025 -2045

Long range water demands for the GCDC-WWS system should be evaluated in 2015 and Phase 2 storage will be evaluated after the plant has been up and running for 12 months.

Memorandum

To	Mike Winegard	Page	1
CC	Ed Tharp, Angel Gebeau		
Subject	Genesee County WTP CT Calculations for Filters and Finished Water Reservoir		
From	Chad Laucamp		
Date	October 30, 2014		

The following is a summary of CT Calculations (attached) that were recently completed for the Genesee County Water Treatment Plant filters and finished water reservoir. These calculations are based on the GCDC water treatment plant receiving a 2.0-log credit from MDEQ for a direct filtration type plant, and also based on the filters and finished water reservoir both having a baffle factor of 0.7. In addition, the required reservoir volume calculations are based on having two filter backwash volumes (0.41 MG) and a minimum required equalization volume (0.21 MG), in addition to the required CT volumes.

Scenario 1 (Conservative Approach)

Assumptions:

- Plant flow of 30 mgd
- 7 of 8 filters in service (1 filter offline)
- Water temperature 0.5 degrees C (33 degrees F)
- Water pH of 8.2
- Chlorine residual of 1.2 mg/L maintained in reservoir (minimum residual req'd in GCDC distribution system)

Table 1 summarizes the findings for Scenario 1, and indicates that if a chlorine residual of 0.5 mg/L is maintained in the filters and a chlorine residual of 1.2 mg/L is maintained in the reservoir, the required reservoir volume is 3.40 MG. If the chlorine residual in the filters is raised to 1.0 mg/L, the required reservoir volume is 3.21 MG.

Table 1
Scenario 1: Conservative Approach - CT Overview

Parameter Description	Chlorine Dosage at Filter Inlet	
	0.5 mg/L	1.0 mg/L
CT Value in Filters	7.85 mg/L-min	15.7 mg/L-min
Log Inactivation of Giardia in Filters	0.078-log	0.14-log
Required Giardia Log-Removal for Disinfection in Reservoir*	0.922-log	0.86-log
Required CT Volume	1.80 MG	1.68 MG
Minimum Reservoir Volume	3.40 MG	3.21 MG

*3.0-log required – 2.0-credit (direct filtration) – log inactivation in filters

Since chlorine is more effective as temperatures increase and plant flows are expected to significantly vary seasonally, the following more realistic operating conditions were evaluated.

Scenario 2 (Cold Operating Conditions)

Assumptions:

- Plant flow of 12 mgd
- 6 filters in service (2 filters on standby and rotated into service)
- Water temperature 0.5 degrees C (33 degrees F)
- Water pH of 8.2
- Two chlorine residual conditions were evaluated for comparison:
    - 1.0 mg/L maintained in reservoir (boosted to 1.2 mg/L at reservoir outlet to provide required residual for GCDC distribution system)
    - Chlorine residual of 1.2 mg/L maintained in reservoir (minimum residual req'd in GCDC distribution system)

Table 2 summarizes the findings for Scenario 2 – Cold Operating Conditions. The results indicate that if a chlorine residual of 0.5 mg/L is maintained in the filters, a reservoir volume of 1.81 MG is required for a chlorine residual in the reservoir of 1.0 mg/L, and a reservoir volume of 1.65 MG is required for a chlorine residual in the reservoir of 1.2 mg/L. If the chlorine residual in the filters is boosted to 1.0 mg/L, a reservoir volume of 1.62 MG is required for a chlorine residual in the reservoir of 1.0 mg/L, and a reservoir volume of 1.48 MG is required for a chlorine residual in the reservoir of 1.2 mg/L. These results indicate a significant decrease in required reservoir storage volume over Scenario 1, which is driven by reduced water demands expected during cold weather months.

Table 2
Scenario 2: Cold Operating Conditions - CT Overview

Parameter Description	Chlorine Dosage at Filter Inlet	
	0.5 mg/L	1.0 mg/L
CT Value in Filters	16.8 mg/L-min	33.6 mg/L-min
Log Inactivation of Giardia in Filters	0.17-log	0.31-log
Required Giardia Log-Removal for Disinfection in Reservoir*	0.83-log	0.69-log
1.0 mg/L chlorine residual in reservoir		
Required CT Volume	0.76 MG	0.63 MG
Minimum Reservoir Volume	1.81 MG	1.62 MG
1.2 mg/L chlorine residual in reservoir		
Required CT Volume	0.65 MG	0.54 MG
Minimum Reservoir Volume	1.65 MG	1.48 MG

*3.0-log required – 2.0-credit (direct filtration) – log inactivation in filters

Scenario 3 (Warm Operating Conditions)

Assumptions:

- Plant flow of 30 mgd
- 7 of 8 filters in service (1 filter offline)
- Water temperature 15 degrees C (59 degrees F)
- Water pH of 8.2
- Two chlorine residual conditions were evaluated for comparison:

- 1.0 mg/L maintained in reservoir (boosted to 1.2 mg/L at reservoir outlet to provide required residual for GCDC distribution system)
- Chlorine residual of 1.2 mg/L maintained in reservoir (minimum residual req'd in GCDC distribution system)

The following table summarizes the findings for Scenario 3 – Warm Operating Conditions. The results indicate that if a chlorine residual of 0.5 mg/L is maintained in the filters, a reservoir volume of 1.62 MG is required for a chlorine residual in the reservoir of 1.0 mg/L, and a reservoir volume of 1.50 MG is required for a chlorine residual in the reservoir of 1.2 mg/L. If the chlorine residual in the filters is boosted to 1.0 mg/L, a reservoir volume of 1.40 MG is required for a chlorine residual in the reservoir of 1.0 mg/L, and a reservoir volume of 1.30 MG is required for a chlorine residual in the reservoir of 1.2 mg/L. These results indicate a decrease in required reservoir storage volume, even when compared to Scenario 2, which is driven by chlorine being more effective as temperatures increase.

Table 3
Scenario 3: Warm Operating Conditions - CT Overview

Parameter Description	Chlorine Dosage at Filter Inlet	
	0.5 mg/L	1.0 mg/L
CT Value in Filters	7.85 mg/L-min	15.7 mg/L-min
Log Inactivation of Giardia in Filters	0.22-log	0.40-log
Required Giardia Log-Removal for Disinfection in Reservoir*	0.78-log	0.60-log
1.0 mg/L chlorine residual in reservoir		
Required CT Volume	0.63 MG	0.49 MG
Minimum Reservoir Volume	1.62 MG	1.40 MG
1.2 mg/L chlorine residual in reservoir		
Required CT Volume	0.55 MG	0.42 MG
Minimum Reservoir Volume	1.50 MG	1.30 MG

*3.0-log required – 2.0-credit (direct filtration) – log inactivation in filters

Summary

The current finished water reservoir design indicates a size of approximately 2.6 MG, which is based on conservative assumptions made during preliminary engineering and an initial assumption that the plant would receive a 2.5-log credit for removal of Giardia by conventional treatment. However, MDEQ has recently indicated that the plant would instead be classified as direct filtration and only be granted a 2.0-log credit, which requires an additional 0.5 log-removal of Giardia. While additional log-removal signifies the need for a larger sized reservoir, the results detailed in this memorandum indicate that taking a more practical, less conservative approach to calculating CT log-credits utilizing the filters for additional CT time, corresponding reservoir volumes offset the additional log-removal requirements. While the current 2.6 MG reservoir size is larger than what is required by the analysis in this memorandum, we recommend that no changes to the reservoir size be considered until MDEQ reviews and approves the assumptions and approach that are detailed within.

Furthermore, having some excess reservoir capacity does provide the plant some flexibility with regards to chlorine dosage points and concentrations, as well as provide additional equalization storage that allows the plant the flexibility of operating at a lower water level during extreme conditions. Based on a worst case reservoir capacity of 1.81 MG required in Scenario 2, the 2.60 MG

reservoir would have an operating range from the maximum water level of 15 feet down to approximately 10.5 feet water depth. If the reservoir is maintained full during a Scenario 2 cold operating condition, the plant could achieve a maximum capacity of 24.6 mgd due to the excess volume available for CT, which is approximately twice the capacity that is expected to be typical for cold operating conditions.

Pat,

The leakage calculation has surfaced again with respect to the KWA pipeline project. Initially, Genesee County was agreeable to using the AWWA C-604 leakage formula; however, after making further calculations they feel that the formula which uses the number of joints (L (g/hr) = JD sqrtP/7400) is far more conservative than the allowable leaking from C-604 and they wish to hold their contractors to that. On the surface, the joint formula appears more conservative; however, they base it on the assumption that the welded joints do not count. If we include all of the welded joints, the allowable leakage is rather close between each formula – depending on pipe length. I will verify the allowable leakage based on actual pipe length and all joints (welded and appurtenances) for comparison. Daryl and I would like to confirm the validity of their assumption.

Subject: RE: Contract S-4002 100% and S-4003 90% Submttals - MDEQ comments

I would like to revisit the conversation this morning regarding the pressure test. The new leakage method based on AWWA 604-11 the 66" pipe would allow 55 gal/mile leakage in a 2 hour period. The current specified method in section 02315 would allow roughly 0.2 gal/mile leakage in a 2 hour period depending on the pressure (150 to 350 psi) and the(J) number of joints 1 per mile to 12 per mile (welded joints do not count so only the valves count on the 66" line, but if you count the hydrants, and air release valves, which are not normally counted, it could be 6-12 per mile depending on the section). Note that you would have to have about 165 joints per mile (an average of 1 joint every 32 feet) @ 350 psi to equal the 55 gal per 2 hours allowed by the new formula. For 150 psi, it would have to have the equivalent of 252 joints per mile to get the 55 gal leakage in 2 hours that is allowed by the new method. The current specification indicates to test at the pressure equal to the pressure class listed on the drawings, where the new version would say test at no more than 125% of the working pressured. The working pressure is not defined anywhere so is that the pressure class of the pipe, or the pressure within the pipe that is expected during operation?

The 60" would be somewhat similar to the 66", except the pressures would be lower on the 60" pipe.

With that being said will the MDEQ allow the current specifications to remain or do we need to still reference AWWA 604-11 for testing even though the allowable leakage is well above what we are allowing.

Subject: Contract S-4002 100% and S-4003 90% Submttals - MDEQ comments

We've completed the review of both projects and the only significant issues that resulted were the Leakage Test formulas that Mike Prysby identified in his review of S-4005. When the corrected specs are received, I am prepared to issue the permit for S-4002. If I have them by early afternoon on Monday, June 23rd, I can bring the permitted plans and specifications to the June 24th meeting. I'm willing to replace the corrected section of the spec into the previously submitted specs if that is easier. Emailing them to me would be fine.

Thanks,

Daryl J. Gotham, P.E.
Michigan Department of Environmental Quality
Office of Drinking Water & Municipal Assistance
Saginaw-Bay District Office

weekly basis. All quality control tests conducted by the manufacturer for each production run of pipe shall be submitted to the Engineer on a weekly basis.

2. Welding Reports for each field welded joint shall be submitted to Engineer on a daily basis. The Welding Report shall include: weld joint station number based on the record drawings; date of weld; welder's name and signature; and actual weld size at four quadrants of pipe and total number of weld passes.
3. When a section of pipe and appurtenances has been completed and bedding materials is in place, provide the appliances, facilities, and water required for performing the specified pressure and leakage tests, as well as deflection testing.
4. After testing is complete drain the pipeline without injury to the work or surrounding area.
5. Contractor will be required to fully uncover a total of ten (10) joints, selected at random by the Engineer, so that the Engineer can visually inspect joints after welding from the pipe interior to verify integrity of welding and joint coating. Additional joints may be required to be uncovered, without limit, if problems are observed at the uncovered joints.

B. Pressure Test:
1. Subject all newly laid pipe or any valved sections of it to a hydrostatic pressure equal to the pipe pressure as indicated on the Contract Drawings.
   a. Test Duration: 2 hours minimum, 6 hours maximum.
   b. Slowly fill each section with potable water.
   c. Expel all air from the pipe by means of taps at the highest elevations.
   d. Plug the taps.
   e. Remove and replace any cracked or defective pipe discovered during test.
   f. The test pressure must hold for the duration of the test.
   g. Repeat the pressure test until satisfactory.
   h. Provide pipe manufacturer's test plugs or proper size and number, of adequate thickness with proper ribbing and stiffening for test pressures specified.
   i. Pressure testing may be done in conjunction with the leakage testing.

C. Leakage Test:
1. After completion of the pressure test, conduct a leakage test to determine the quantity of water lost under the specified leakage test pressure.
   a. Leakage test pressure is the maximum operating pressure of the section under test and is based on the elevation of the test gauge.
   b. Duration of each leakage test: Minimum of 2 hours in addition to the pressure test period.
2. Allowable leakage in gal/hr for pipelines: Not greater than that determined as follows:

   Allowable Leakage (Gal/Hr) = (J X D X Sqrt (P)) / 7400

   Where:

   J is the total Number of flanged, gasket, or push-on joints in tested length (excluding welded joints).

   D is the Pipe diameter in inches.

   P is the Average test pressure in psig.

Sqrt is the Square root operator.

3. Leakage is defined as the quantity of water supplied in the newly laid pipe or any valved section under test that is necessary to maintain the specified leakage test pressure after the pipe has been filled with potable or raw water and the air expelled.
4. All visible leaks are to be repaired regardless of the amount of leakage.
5. When leakage testing is performed against closed sectioning valves, the test shall be performed on each side of the valves independently.
6. Leakage testing may be done concurrently with the pressure testing.

D. Deflection Testing and Report:
1. After completion of construction and backfilling, prior to pressure and leakage testing, deflection testing is required for each pipe segment.
   a. Maximum allowable internal deflection is 3 percent (pipe out of round).
   b. A deflection testing report is required for each pipe section identified by the corresponding pipe section listed in the approved lay schedule or according to the record drawings.
   c. Failure to pass the deflection testing will require reworking of the pipe bedding, backfill and compaction at no cost to the Owner. Severe violations, as determined solely by the Engineer/Owner shall require removal and replacement of the unsatisfactory piping at no cost to the owner.

E. Weld Testing Report:
1. After completion of welding, prior to pressure and leakage testing, an inspection report of each field weld, for both the inside and the outside of the pipe at the weld, is required where any field welding has occurred (restrained joints, access manholes, etc.)
   a. The location of the weld is to be indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings.
   b. The report shall have the information for both the inside and the outside of each particular weld coordinated such that they both are located together in the report.
   c. A photograph of each weld location is to be included in the report with the date, and location indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings.

F. Exterior Joint Protection or Pipe Repair Report:
1. After completion of shrink wrapping each welded joint or exterior pipe repair, prior to backfilling, an exterior inspection report of each joint protection and repair is required.
   a. The location of the joint (or repair area) is to be indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings.
   b. A photograph of each joint or repair location is to be included in the report with the date, and location indicated by the corresponding pipe section listed in the approved lay schedule and/or stationing according to the record drawings.

AWWA Standard

This document is an American Water Works Association (AWWA) standard. It is not a specification. AWWA standards describe minimum requirements and do not contain all of the engineering and administrative information normally contained in specifications. The AWWA standards usually contain options that must be evaluated by the user of the standard. Until each optional feature is specified by the user, the product or service is not fully defined. AWWA publication of a standard does not constitute endorsement of any product or product type, nor does AWWA test, certify, or approve any product. The use of AWWA standards is entirely voluntary. This standard does not supersede or take precedence over or displace any applicable law, regulation, or codes of any governmental authority. AWWA standards are intended to represent a consensus of the water supply industry that the product described will provide satisfactory service. When AWWA revises or withdraws this standard, an official notice of action will be placed on the first page of the classified advertising section of *Journal AWWA*. The action becomes effective on the first day of the month following the month of *Journal AWWA* publication of the official notice.

American National Standard

An American National Standard implies a consensus of those substantially concerned with its scope and provisions. An American National Standard is intended as a guide to aid the manufacturer, the consumer, and the general public. The existence of an American National Standard does not in any respect preclude anyone, whether that person has approved the standard or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standard. American National Standards are subject to periodic review, and users are cautioned to obtain the latest editions. Producers of goods made in conformity with an American National Standard are encouraged to state on their own responsibility in advertising and promotional materials or on tags or labels that the goods are produced in conformity with particular American National Standards.

CAUTION NOTICE: The American National Standards Institute (ANSI) approval date on the front cover of this standard indicates completion of the ANSI approval process. This American National Standard may be revised or withdrawn at any time. ANSI procedures require that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of publication. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute, 25 West 43rd Street, Fourth Floor, New York, NY 10036; (212) 642-4900, or e-mailing info@ansi.org.

Foreword

This foreword is for information only and is not a part of ANSI/AWWA C604.*

I. Introduction.

I.A. *History.* This standard pertains to the in-ground installation of steel pipelines for use in the distribution and transmission of water, air, and other products in water system facilities. It has been prepared by the AWWA Standards Committee on Steel Pipe, initially formed as Committee A7A in 1939. At that time, the Steel Water Pipe Manufacturers Technical Advisory Committee was organized as a subsidiary group to function as a source of technical information for the parent committee. Committee A7A and its successors, Committee 8310D and the AWWA Standards Committee on Steel Pipe, have assumed responsibility for all AWWA standards and manuals pertaining to steel pipe, fittings, linings and coatings, field installations, and related items.

In 1996 the AWWA Standards Council directed the Standards Committee on Steel Pipe to develop a standard for the installation of steel pipelines and their appurtenances used in water treatment or conveying facilities. The first edition of AWWA C604 was approved by the AWWA Board of Directors on Feb. 12, 2006. This second edition was approved on Jan. 23, 2011.

I.B. *Discussion.* ANSI/AWWA C604 includes all types of steel pipe 4 in. (100 mm) in diameter and larger typically used in the water industry, regardless of pipe manufacturing source. With adequate quality assurance, pipe manufactured in a fabricator's shop or in a steel-pipe mill is suitable for water utility service. Pipe produced in a fabricator's shop or pipe mill for installation in accordance with ANSI/AWWA C604 shall meet the stringent design, quality control, and testing requirements of AWWA Manual M11 and ANSI/AWWA C200. Shop and mill-fabricated pipe made from materials and in accordance with the quality control measures stipulated in AWWA Manual M11 and ANSI/AWWA C200 will ensure fabricated pipe of high quality.

I.C. *Acceptance.* In May 1985, the US Environmental Protection Agency (USEPA) entered into a cooperative agreement with a consortium led by NSF International (NSF)† to develop voluntary third-party consensus standards and a

* American National Standards Institute, 25 West 43rd Street, Fourth Floor, New York, NY 10036.
† NSF International, 789 North Dixboro Road, Ann Arbor, MI 48105.

certification program for direct and indirect drinking water additives. Other members of the original consortium included the American Water Works Association Research Foundation (AwwaRF, now Water Research Foundation*) and the Conference of State Health and Environmental Managers (COSHEM). The American Water Works Association (AWWA) and the Association of State Drinking Water Administrators (ASDWA) joined later.

In the United States, authority to regulate products for use in, or in contact with, drinking water rests with individual states.† Local agencies may choose to impose requirements more stringent than those required by the state. To evaluate the health effects of products and drinking water additives from such products, state and local agencies may use various references, including

1. An advisory program formerly administered by USEPA, Office of Drinking Water, discontinued on Apr. 7, 1990.
2. Specific policies of the state or local agency.
3. Two standards developed under the direction of NSF, NSF/ANSI 60, Drinking Water Treatment Chemicals—Health Effects, and NSF/ANSI 61, Drinking Water System Components—Health Effects.
4. Other references, including AWWA standards, *Food Chemicals Codex*, *Water Chemicals Codex*,‡ and other standards considered appropriate by the state or local agency.

Various certification organizations may be involved in certifying products in accordance with NSF/ANSI 61. Individual states or local agencies have authority to accept or accredit certification organizations within their jurisdiction. Accreditation of certification organizations may vary from jurisdiction to jurisdiction.

Annex A, "Toxicology Review and Evaluation Procedures," to NSF/ANSI 61 does not stipulate a maximum allowable level (MAL) of a contaminant for substances not regulated by a USEPA final maximum contaminant level (MCL). The MALs of an unspecified list of "unregulated contaminants" are based on toxicity testing guidelines (noncarcinogens) and risk characterization methodology (carcinogens). Use of Annex A procedures may not always be identical, depending on the certifier.

---

ANSI/AWWA C604 does not address additives requirements. Thus, users of this standard should consult the appropriate state or local agency having jurisdiction in order to

1. Determine additives requirements, including applicable standards.
2. Determine the status of certifications by parties offering to certify products for contact with, or treatment of, drinking water.
3. Determine current information on product certification.

II. Special Issues.

II.A. *Application.* ANSI/AWWA C604, Standard for Installation of Buried Steel Water Pipe—4 In. (100 mm) and Larger, can be used as a reference when making extensions to existing distribution or transmission systems or when constructing new distribution or transmission systems using steel pipe. It is not the intent for this standard to be used as a contract document, but it may be used as a reference in contract documents. It is based on a consensus of the committee on the minimum practice consistent with sound, economical service under normal conditions, and its applicability under any circumstances must be reviewed by a responsible engineer. The standard is not intended to preclude the manufacture, marketing, purchase, or the use of any product, process, or procedure.

III. Use of This Standard. It is the responsibility of the user of an AWWA standard to determine that the products described in that standard are suitable for use in the particular application being considered.

III.A. *Purchaser Options and Alternatives.* The following items should be provided by the purchaser.

Considerable supplemental information is required in conjunction with the use of this standard, including, but not limited to, purchaser's documents consisting of detailed plans and specifications. The purchaser's documents should cover, as a minimum, detailed instructions pertaining to all references in this standard to "as specified" and "in accordance with the purchaser's documents." In addition, the purchaser shall provide specific supplementary information to the purchaser's documents regarding the following:

1. Standard used—that is, ANSI/AWWA C604, Installation of Buried Steel Water Pipe–4 In. (100 mm) and Larger, of latest revision.
2. Whether compliance with NSF/ANSI 61, Drinking Water System Components—Health Effects, is required.
3. Pipe design criteria and type of pipe ends.

Provided by IHS
No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

4. Pipe-laying schedules, line drawings, markings, appurtenances, vaults, valves, and existing utilities.

5. Pipe bedding specification and drawing details.

6. Inspection for pipe joints, protective coatings and linings, and pipe zone compaction.

7. Surface restoration.

8. Special handling requirements.

9. Details of other federal, state or provincial, and local requirements (Sec. 4.2).

10. Whether proof testing of the weld after backfill method is required for the project-specific conditions, including testing protocols (Sec. 4.4.4.2). NOTE: The exterior protective joint coating, backfill material, use of thin-wall pipe, and welding procedures should be considered with this process.

III.B. *Modification to Standard.* Any modification of the provisions, definitions, or terminology in this standard must be provided by the purchaser.

IV. Major Revisions. Major revisions made to the standard in this edition include the following:

1. The format has been changed to AWWA standard style.

2. Added Standards Council materials language as new Sec. 4.2.

3. Revision of trench widths, Sec. 4.4.2.3.

4. Revision of rock conditions, Sec. 4.4.2.6.

5. The section on unsuitable subgrade material was revised, Sec. 4.4.2.10.

6. An additional paragraph was added on pipe installation, Sec. 4.4.3.

7. A section on pipe on steep grades was added, Sec. 4.4.3.6.

8. Revisions were made to the section on pipe placement for rubber-gasketed joints (Sec. 4.4.4.1.1).

9. Revisions were made to the section on pipe placement for welded lap joints (Sec. 4.4.4.2).

10. An additional paragraph was added regarding the weld-after-backfill method (Sec. 4.4.4.2).

11. The procedure for flanged joints was revised (Sec. 4.4.4.4.).

12. A new Figure 5 was added for bolt torque sequence.

13. Revisions were made to the welded joints section (Sec. 4.4.4.9).

14. Additional information was added on heat-shrink sleeve installation in Sec. 4.4.4.13.3.

15. Additional information was added regarding cement mortar for field joints and repairs (Sec. 4.4.4.13.4).

16. Sec. 4.4.5, Fitting installation, was deleted.

17. Revisions were made to the section on backfilling (Sec. 4.4.6).

18. Figure 5, Pipe bedding, was replaced with new Figure 6, Trench cross section.
19. A new Table 1 on soil stiffness categories was added.
20. Revisions were made to test restrictions, Sec. 5.2.1.
21. A new section on affidavit of compliance was added, Sec. 6.2.

V. Comments. If you have any comments or questions about this standard, please call AWWA Engineering and Technical Services at 303.794.7711, FAX at 303.795.7603, write to the department at 6666 West Quincy Avenue, Denver, CO 80235-3098, or e-mail at standards@awwa.org.

ANSI/AWWA C604-11
(Revision of ANSI/AWWA C604-06)

American Water Works Association

AWWA Standard

Installation of Buried Steel Water Pipe—4 In. (100 mm) and Larger

SECTION 1: GENERAL

Sec. 1.1 Scope

This standard provides the field installation guidelines for buried steel water pipe, 4 in. (100 mm)* and larger.

The information contained in this standard is intended to be used as a guide to assist in the installation of steel water pipe.

1.1.1 *Conditions that may require additional considerations.* Installations that require special attention, techniques, and materials are not covered by this standard. Some of these installations are

1. Piping through rigid walls or structures.
2. Connections to appurtenances.
3. Piping on supports or on piles above or below ground.
4. Piping subject to significant thermal stresses.
5. Treatment plant or pump-station piping.
6. Industrial piping.
7. Piping in seismic areas.

* Metric conversions given in this standard are direct conversions of US customary units and are not those specified in the International Organization for Standardization (ISO) standards.

Copyright © 2011 American Water Works Association. All Rights Reserved.
Provided by IHS
No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

8. Piping in high-density, stray-current environments.
9. Piping through unstable soils or soils subject to sliding or soil drag.
10. Piping subject to excessive live loads.
11. Piping with cover less than 3 ft (900 mm).
12. Piping installed by horizontal directional drilling (HDD).

Sec. 1.2 Purpose

The purpose of this standard is to provide the minimum requirements for the installation of buried steel water pipelines, including inspection, unloading, handling, storage, and testing.

Sec. 1.3 Application

This standard is intended to cover typical pipeline construction practices that are deemed adequate for the satisfactory installation of steel water pipelines. Individual project requirements can vary substantially and should always be thoroughly reviewed before bidding or construction startup. For this reason, some practices discussed in this standard may not be suitable for all project conditions, and in some cases, specialized installation techniques may be required that are beyond the scope of this standard.

SECTION 2: REFERENCES

This standard references the following documents. In their latest editions, the referenced documents form a part of this standard to the extent specified herein. In case of conflict, the requirements of this standard shall prevail.

AWWA M11—*Steel Water Pipe: A Guide for Design and Installation.*

SECTION 3: DEFINITIONS

The following definitions shall apply in this standard:

1. *Bell-and-spigot or lap joint:* A circumferential joint in which one of the members joined overlaps the other.

2. *Bevel:* The angle formed between the prepared edge of a pipe end and a plane perpendicular to the longitudinal axis of the pipe. Bevels are generally used for butt welding of pipe ends.

* American Welding Society, 550 N.W. LeJeune Road, Miami, FL 33126.

No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

3. *Butt joint:* A pipe joint in which the two pipe ends are in the same plane and do not overlap. This joint configuration is commonly beveled and usually includes a backup ring on the side opposite of which field joint welding is to be performed.

4. *Constructor:* The party that provides the work and materials for placement or installation.

5. *Dewatering:* The removal of water in and around construction operations. This usually pertains to underground water within construction zones, which can adversely affect the construction activities.

6. *Fillet weld:* A weld of approximately triangular cross section, the throat of which lies in a plane disposed approximately 45° with regard to the surface of the parts joined. The size of the fillet weld is expressed in terms of the width, in inches, of one of its adjacent fused legs (the shorter leg, if unequal).

7. *Final backfill:* Final backfill begins at top of initial backfill and continues to the top of trench or finished grade.

8. *Grade:* The elevation of a structure or pipeline invert (bottom of the flowline) at a specific location. This elevation is usually measured relative to established survey points at the project.

9. *Haunch:* The area of the trench that begins at the bottom of the pipe and generally extends up to ⅓ of the pipe diameter.

10. *Initial backfill:* Initial backfill begins at the top of the bedding or haunch area and continues to the top of pipe.

11. *Manufacturer:* The party that manufactures, fabricates, or produces materials or products.

12. *Mechanical cutting:* The severing of materials using a power cut-off saw with a thin flat blade having a continuous line of teeth on its edge or high-speed abrasive disk.

13. *Miter:* The angle between the cut of a pipe end and a line drawn perpendicular to the longitudinal axis of the pipe. Miters are used to fabricate elbows and to facilitate pipe laying at changes in horizontal or vertical alignment.

14. *Nominal diameter or size:* The commercial designation or dimension by which pipe is designated for simplicity. Commonly, it is the finished inside diameter after lining.

15. *Nominal weight per foot (for pipe):* The theoretical weight, per foot, calculated from the wall thickness, as distinguished from the actual and measured weight per foot of the finished pipe. Unit weights of 0.284 lb per cubic inch for

Copyright © 2011 American Water Works Association. All Rights Reserved.
Provided by IHS
No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

steel sheet or 490 lb per cubic foot for steel plate shall be used when calculating weight per foot. Unit weights of 0.087 lb per cubic inch, or 150 lb per cubic foot for cement mortar, shall be used when calculating weight per foot.

16. *Pipe bedding:* The material immediately under the pipeline and by which the pipeline is supported. This material is usually of a specific description and may simply be the reuse of the originally excavated material.

17. *Pipe embedment:* The area comprising the pipe bedding plus the initial backfill.

18. *Plain-end pipe:* Pipe that is not threaded, beveled, belled, or otherwise given a special end configuration.

19. *Plans:* Drawings normally prepared by an engineer employed or retained by the purchaser or system-operator showing the location and details for the construction of the pipeline and appurtenances.

20. *Purchaser:* The person, company, or organization that purchases any materials or work to be performed.

21. *Purchaser's documents:* Detailed requirements established by the purchaser or designee, outlining minimum acceptable standards for design, manufacture, quality of installation, or any other criteria the purchaser deems necessary for the procurement of the product required. Installation specifications may incorporate this standard by reference, but should also include specification requirements for matters not covered by the standard.

22. *Random lengths:* Pipe lengths as produced in a pipe mill, to which no special treatment is given to make the lengths uniform.

23. *Special section:* Any piece of pipe other than a normal full-length straight section. This includes but is not limited to elbows, pipe with outlets, short pieces, reducers, adapter sections with special ends, and other nonstandard sections.

24. *Specified lengths:* Sections of finished pipe, the length dimensions of which do not vary from a fixed figure specified by the purchaser by more than the tolerance set forth.

25. *Supplier:* The party that supplies material or services. A supplier may or may not be the manufacturer.

26. *Underground utilities:* Previously installed utilities that are located within the right-of-way of a pipeline or structure. These utilities commonly include gas, power, water, cable TV, sewer, fiber-optic cable, steam lines, and telephone lines.

Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

27. *Utility location service:* The cooperative organization of major utilities to provide services for the location and safe construction practices surrounding their respective utilities. These utilities often provide a site representative during construction when deemed necessary by the utility.

SECTION 4: REQUIREMENTS

Sec. 4.1 Permeation

The selection of materials is critical for potable water, wastewater, and reclaimed water service, and for distribution piping in locations where there is likelihood the pipe will be exposed to significant concentrations of pollutants composed of low-molecular-weight petroleum products, organic solvents, or their vapors. Documented research has shown that pipe materials (such as polyethylene, and polyvinyl chloride) and elastomers, such as those used in jointing gaskets and packing glands, are subject to permeation by low-molecular-weight organic solvents or petroleum products. If a potable water, wastewater, or reclaimed water pipe must pass through such a contaminated area or an area subject to contamination, consult with the manufacturer regarding permeation of pipe walls, jointing materials, and so on *before* selecting materials for use in that area.

Sec. 4.2 Materials

Materials shall comply with the requirements of the Safe Drinking Water Act and other federal regulations for potable water, wastewater, and reclaimed water systems as applicable.

Sec. 4.3 Preconstruction Planning

The installation of steel pipelines usually involves multiple suppliers and subcontractors that have varying preparation requirements. For this reason a preconstruction meeting is strongly recommended to confirm and coordinate the critical path aspects of all involved parties. In particular, pipe and valve materials are usually manufactured to fit specific locations of the project and often require an extended lead time for the purchase of raw material, drawing preparation, and drawing approvals that must precede construction activities. Any preconstruction planning meeting initiated by the purchaser should include all essential suppliers and subcontractors. During the meeting, a schedule should be confirmed that is agreeable to all parties. The meeting also affords all parties the opportunity to elaborate on their respective preparations, such as procurement of materials, preparation

Copyright © 2011 American Water Works Association. All Rights Reserved.
Provided by IHS
No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

of drawings, and submittals. The constructor shall be required to provide the starting location and direction of construction. Care should be taken when preparing the construction schedule as later changes in construction plans may affect shop drawings, laying schedules, delivery dates, and other parties. Shop drawings must be approved by the constructor and purchaser prior to pipe production.

Sec. 4.4 Installation

4.4.1 *Alignment and grade.* Pipelines shall be laid and alignment maintained to the required horizontal line and vertical grade established in the purchaser and constructor approved layout drawings for the project subject to allowable tolerances. Valves and special sections shall be installed at the required locations unless field conditions warrant otherwise and such changes are agreed to by the purchaser and constructor. Valve-operating stems shall be oriented in a manner to allow proper operation.

4.4.1.1 Prior investigation. Prior to excavation, investigation shall be made to the extent necessary to determine the precise location of existing underground utilities, structures, and conflicts. This will require the constructor to contact the utility location service for proper coordination and location of utilities and then perform excavations to verify the elevation at the point of intersection, if the utility falls within the proposed pipe excavation. In addition, care shall be exercised during excavation to avoid damage to existing structures, which may not be identified by the utility location service. Special precautions shall be taken when the pipeline being installed crosses or is adjacent to a facility that is cathodically protected. When obstructions that are not shown on the purchaser's documents are encountered during the progress of work and interfere so that an alteration is required, such alterations or deviation in line and grade or the removal, relocation, or reconstruction of the obstructions shall be performed in accordance with the purchaser's documents.

4.4.1.2 Clearance. When crossing existing pipelines or other structures, alignment and grade shall be adjusted in accordance with the purchaser's documents. Installed pipe and structures shall provide clearance as required by federal, state or provincial, and local regulations. Wherever possible, pipe and structures shall have a minimum clearance of 12 in. (300 mm) from existing pipelines or structures to allow for proper compaction.

4.4.2 *Trench construction.* The trench shall be excavated to the required alignment, depth, and width specified or shown on the purchaser's documents and shall be in conformance with all federal, state or provincial, and local regulations for the protection of workers.

Copyright © 2011 American Water Works Association. All Rights Reserved.

Not for Resale, 06/24/2014 14:10:54 MDT

4.4.2.1 Trench preparation. Trench preparation shall proceed in advance of the pipe installation. The amount of open trench length allowed may be limited by the amount of nonbackfilled pipe, the purchaser's documents, safety, and public impact considerations (such as traffic, slope, etc.).

4.4.2.1.1 Discharges from trench dewatering pumps shall be directed away from the trench, in order not to affect trench stability, and shall be in accordance with federal, state, and local point discharge requirements.

4.4.2.1.2 Excavated material shall be placed in a manner that will not obstruct the work, endanger workers or the public, or obstruct sidewalks, driveways, roadways, and other structures. If obstruction of such structures becomes necessary, the constructor shall plan for alternative means to accommodate the public. Placement of excavated material shall be done in compliance with federal, state or provincial, and local regulations.

4.4.2.2 Pavement removal. Removal of pavement and road surfaces shall be a part of the trench excavation. The amount removed shall depend on the width of trench required for installation of the pipe, including safety requirements and the dimensions of the area into which valves, specials, manways, or other structures will be installed. Methods such as sawing, drilling, or chipping shall be used to ensure the breakage of pavement along straight lines.

4.4.2.3 Trench width. The width of the trench at the top of the pipe shall be as dictated by the purchaser's documents or as necessitated by safety requirements. In any case, the trench width shall provide ample clearance to permit the pipe to be installed and joined properly and to allow the backfill to be placed in accordance with the purchaser's documents and shall be adequate to ensure elimination of voids in the haunch area, and proper placement and compaction of initial backfill materials. If mechanical compaction is required of the initial backfill materials, trench width shall provide clearance on each side of the pipe to allow room for compaction equipment. The trench width at the bottom of the pipe will be governed by the space required for compaction or consolidation equipment. In addition, trenches shall be of such extra width, when required, to permit the placement of sheeting, bracing, and appurtenances as required by the safety requirements of the agency having jurisdiction.

4.4.2.4 Depth. The trench shall be excavated and bedding installed. The bedding shall provide uniform support for the full length of the pipe barrel, except that a slight depression may be provided to facilitate the removal of pipe slings or other lifting devices without damaging the pipe coating. Pipe bedding and backfill

Not for Resale, 06/24/2014 14:10:54 MDT

material shall be installed so as to avoid abrasion or other damage to the coating on the pipe.

4.4.2.5 Bell holes. Holes for the pipe bells shall be provided at each joint. Holes shall be adequately sized for completing any external coatings, but shall be no larger than necessary to allow joint assembly. If the pipe joints are welded or coupled, the bell holes shall provide adequate clearance for welding or assembly and subsequent external coatings.

4.4.2.6 Rock conditions. If excavation of rock is necessary, all rock shall be removed to provide a clearance below and on each side of all pipe, valves, and fittings. The minimum clearance shall be 6 in. (150 mm) for pipe with an outside diameter (OD) up to 24 in. (600 mm) and 10 in. (250 mm) for pipe with an OD greater than 24 in. (600 mm). When the excavation is completed, a layer of appropriate subgrade material (see Sec. 4.4.6.1) shall be placed on the bottom of the trench, graded, and compacted to provide uniform support for the entire length of pipe and the placement of the loose bedding material up to the bottom of the pipe. These clearances and bedding procedures shall also be observed for pieces of concrete or masonry and other debris or subterranean structures, such as masonry walls, piers, or foundations that may be encountered during excavation.

4.4.2.7 Previous excavations. Should the trench pass over a sewer or other previous excavation, the trench shall be sufficiently compacted to provide support equal to that of the native soil or conform to other regulatory requirements in a manner that will prevent damage to the existing installation.

4.4.2.8 Blasting. Blasting for excavation shall be permitted only after securing approval(s) and establishing the hours of blasting as required by the purchaser's documents. The blasting procedure, including protection of existing utilities, persons, and property, shall be in strict accordance with federal, state or provincial, and local regulations.

4.4.2.9 Protection of existing structures. Temporary support, adequate protection, and maintenance of all underground and surface structures, drains, sewers, and other obstructions encountered in the progress of the work shall be provided in accordance with the purchaser's documents and applicable regulations.

4.4.2.10 Unsuitable subgrade material. When the subgrade is found to include ashes, cinders, refuse, organic material, or other unsuitable material, such material shall be removed to at least 6 in. (150 mm) below the bottom of the pipe for pipe with an outside diameter (OD) up to 24 in. (600 mm) and 10 in. (250 mm) for pipe with an OD greater than 24 in. (600 mm). The removed material shall be

Not for Resale, 06/24/2014 14:10:54 MDT

replaced with clean, suitable subgrade material in accordance with the purchaser's documents or as directed by the purchaser. Once unsuitable material is removed or replaced, the bedding material shall be placed and graded so that the bedding will provide uniform support for the entire length of the pipe.

4.4.2.11 Unstable subgrade. When the bottom of the trench or the subgrade consists of material that is unstable to such a degree that it cannot be removed, a foundation for the pipe and/or appurtenance shall be constructed in accordance with the purchaser's documents or as directed by the purchaser.

4.4.3 *Pipe installation.* Proper implements, tools, and facilities shall be provided and used for the safe and convenient performance of the work. All pipe, fittings, and valves shall be lowered carefully into the trench by means of a backhoe or crane, using nylon slings, guide ropes, or other suitable tools or equipment, in such a manner as to prevent damage to the pipe, protective coatings, and linings. Pipe shall not be dropped or dumped into the trench. The trench shall be dewatered prior to installation of the pipe and maintained until the pipeline is substantially covered as necessary to prevent pipe from floating.

At all times during construction of the pipeline, precautions shall be taken to prevent damage to the protective coating. Coating damaged during installation shall be repaired in accordance with this and other applicable AWWA standards.

4.4.3.1 Examination of material. All pipe, fittings, coatings, and appurtenances shall be examined carefully for damage and other defects upon arrival at the installation site and immediately before assembly in the trench. Defective materials shall be marked and held for final disposition as required by the purchaser's documents.

4.4.3.2 Pipe ends. All deleterious materials shall be removed from the ends of each pipe. For bell-and-spigot pipe, the outside of the spigot end and the inside of the bell shall be wiped clean and dry so that it is free from dirt, sand, grit, and other foreign matter before the pipe is installed.

4.4.3.3 Pipe cleanliness. As installation progresses, no debris, tools, clothing, or other materials shall be allowed to accumulate in the pipe during construction and shall be prevented from entering the pipe while being placed in the trench.

4.4.3.4 Direction of bells. It is common practice to lay lap-welded pipe joints with the spigot facing the direction in which work is progressing. For rubber-gasketed pipe, common practice is to lay the pipe joints with the bell facing the direction in which work is progressing to prevent debris from being scooped into the bell. The direction of the bells is not functionally related to the direction of flow within the system.

4.4.3.5 Pipe end caps. When pipe laying is not in progress, cover, cap, or secure the open ends of pipe where required. If used, the end caps shall remain in place until the trench work proceeds. When pipe caps are in place, care must be taken to prevent pipe flotation should the trench fill with water.

4.4.3.6 Pipe on steep grades. On grades exceeding 10 percent, the pipe should be laid uphill or otherwise held in place by approved methods.

4.4.4 *Joint assembly and testing.* Proper implements, tools, and facilities shall be provided and used for the safe and convenient performance of the work. The types of joints covered in this standard include gasketed, flanged, sleeve couplings, split-sleeve couplings, expansion joints, and welded joints, all of which have specific applications. The joint types required for a project will be dictated by the purchaser's documents.

The joint assembly shall be coated with a compatible material according to the coating manufacturer's recommendations and the applicable AWWA standard.

4.4.4.1 Rubber-gasketed joints. Gasketed joints consist of a bell-and-spigot end configuration formed directly into the steel pipe cylinder or attached to the steel pipe cylinder. The spigot end includes a groove that retains an O-ring gasket. The gasket groove and the bell end of the mating pipe shall be cleaned thoroughly. When the spigot is inserted into the bell, the gasket compresses between the steel surfaces to form a watertight seal. Rubber-gasketed joints shall be assembled as described in Sec. 4.4.4.1.1 and illustrated in Figures 1 and 2.

4.4.4.1.1 Pipe placement for rubber-gasketed joints. Mark the outside of the pipe at the quarter points for the minimum stab depth. This dimension is provided on the shop joint detail drawings. Lift the pipe using the appropriate method. On steep slopes, it may be advisable to use slings as chokers. Visually inspect the O-ring gasket for any visible defects, cuts, tears, or excessive stretching. Stretch the O-ring gasket over the pipe spigot end by hand or by using a dull pry bar (to avoid cuts or tears), and then carefully seat the gasket into the O-ring groove on the spigot (see Figure 1). After placement, relieve tension in the gasket by running a dull object, such as a wooden dowel, between the gasket and the spigot groove around the pipe circumference several times. Just prior to stabbing, apply a light coat of vegetable-based pipe lubricant to the spigot end exterior and the bell end interior, being sure to keep the joint clean. The spigot end shall be stabbed approximately 1 in. (25 mm) into the bell end, with the two mating pieces in reasonably straight alignment (see Figure 2). The spigot shall then be engaged the appropriate distance. Rubber-gasketed pipe may be joined using a choker sling

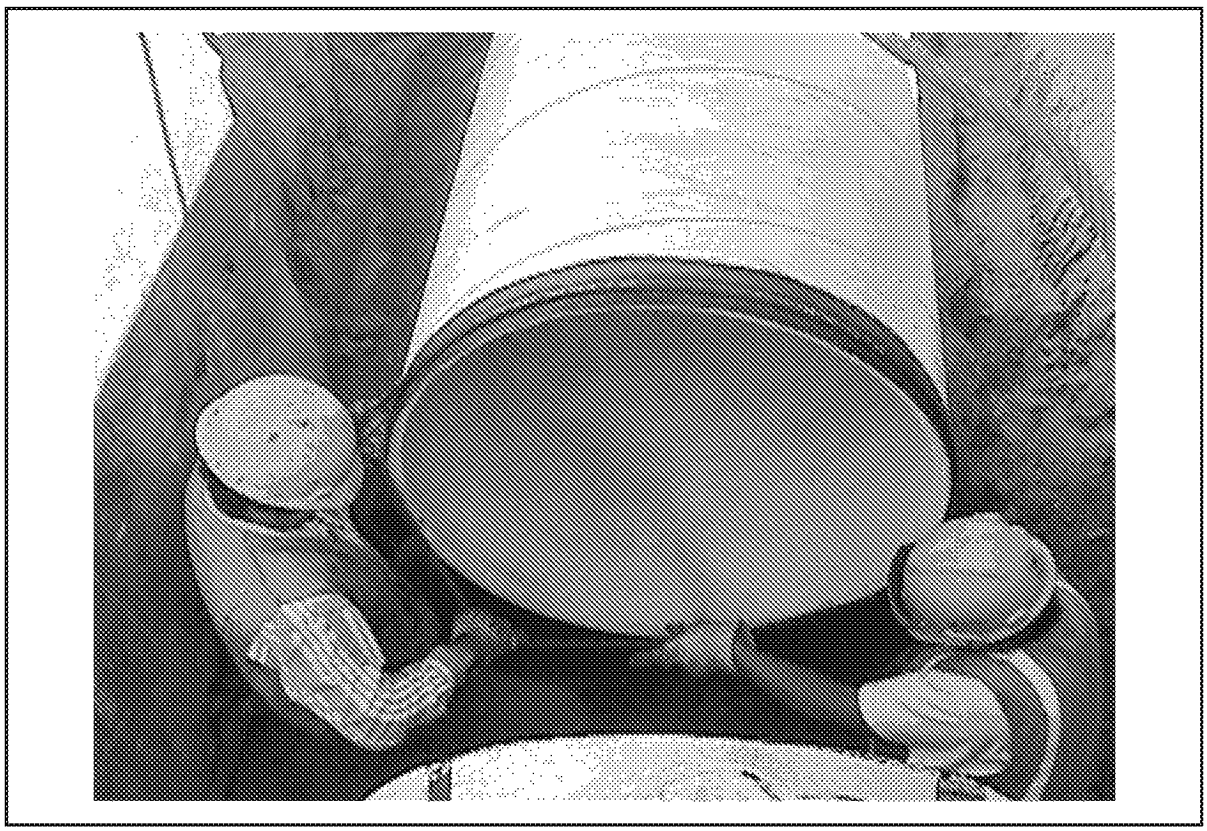

Figure 1 Typical O-ring gasket assembly

attached to the excavator bucket and drawing the pipe joint to full engagement. Small-diameter pipe spigots may be pushed into the bell with a long pry bar. Large-diameter pipe may be pushed into the bell using the bucket of the excavator and appropriately sized timber, which is used to equalize the assembly loads and reduce the risk of damage to the bell, or pulled together using a winch or come-a-long. As each length of pipe is placed in the trench, the pipe shall be brought to the correct line and grade. After the joint is properly engaged, deflect the joint, if required, within the prescribed limits in Sec. 4.4.4.3 (see Figure 4) or the purchaser's documents. The pipe shall be secured in place with approved backfill material.

4.4.4.1.2 Rubber-gasketed joint testing. After the pipe has been laid to final grade, the rubber-gasketed joint shall be tested using a feeler gauge. This test ensures the gasket has not rolled out of the groove, or "fish-mouthed." Perform this test by inserting a feeler gauge from the outside of the joint between the bell and spigot until reaching the gasket. Continue completely around the pipe circumference to ensure the gasket is properly seated. Do not force the feeler gauge past the

Not for Resale, 06/24/2014 14:10:54 MDT

gasket. The only purpose of the feeler gauge test is to determine whether the gasket has rolled out of the groove during installation; it is not to determine the amount of clearance between the spigot and the bell.

4.4.4.1.3 Repair of rubber-gasket joints. If the gasket has disengaged, the joint shall be pulled apart, and the gasket shall be removed and checked for any damage. Reinstall the gasket, or if damaged, install a new gasket following the procedure in Sec. 4.4.4.1.1. Alternatively, if a pipe segment cannot be removed, seal-weld the interior of the joint, or insert a rolled steel round bar into the flare of the bell and seal-weld the round bar to the bell and spigot.

4.4.4.2 Pipe placement for welded lap joints. Mark the outside of the pipe at the quarter points for the required stab depth range. This dimension is provided on the joint detail drawings. It should be noted that interior lap-welded pipe should never be engaged to the point where the weld would be within 1 in. (25 mm) of the tangency of the point of bell radius. See Sec. 4.4.4.9.1 for more detail. Standard lap-welded joints consist of a single fillet weld made on either the interior or exterior of the pipe. On steep slopes, it may be advisable to use slings as chokers. Lower the pipe segment, bell end first, at an approximate 5° to 10° angle relative to the previously laid pipe segment. This will allow the bell edge to overlap the spigot (of the previously laid pipe) to the proper stab depth mark. On large-diameter pipe, a small tack weld may be placed onto the exterior of the bell and spigot at the "field top." This tack will act as a hinge that will guide the remainder of the bell insertion as the pipe is lowered (see Figure 3). The tack welds may remain as part of the permanent weld if the welder is properly qualified and the weldment meets the requirements of ANSI/AWWA C206 and the purchaser's documents. Under certain circumstances, some constructors may choose to insert the spigot straight into the bell by methods described in Sec. 4.4.4.1.1. As each length of pipe is placed in the trench, the joint shall be assembled and checked for stab depth, and the pipe shall be brought to correct line and grade. After the joint is properly engaged, deflect the joint, if required, within the prescribed limits in Sec. 4.4.4.3 or the purchaser's documents. If required by the purchaser's documents, proceed with the exterior or interior welding of the joint in accordance with ANSI/AWWA C206. If required by the purchaser's documents, perform nondestructive testing of the weld. Upon completion of the welding and/or weld testing, apply field joint coating per the appropriate standard. The pipe shall then be secured in place with approved initial backfill material. After backfilling the pipe, the interior lining at the joint shall be completed.

Weld-after-backfill is also an acceptable method for welding the pipe. This method involves assembling the pipe joint as described above, deflecting the joint if required, applying the appropriate exterior protective coating to the joint, and backfilling the pipe prior to welding the interior joint. Welding is done on the inside of the pipe after the backfill is complete. With inside single-welded joints, this method can reduce or eliminate thermal stress issues associated with welding pipe exposed to the sun or atmosphere. Once interior welding and/or weld testing is complete, the interior lining at the joint may be completed. Project-specific conditions and materials can vary, such as the exterior protective joint coating, backfill materials, use of thin-wall pipe, and welding procedures, which may warrant testing to verify the method at the start of construction.

4.4.4.3 Joint deflection. When it is necessary to deflect rubber-gasketed or lap-welded pipe joints from a straight line in either the horizontal line or vertical grade, the amount of joint deflection shall not exceed that amount which would affect the watertight seal for rubber-gasketed joints or that amount which results in a field weld closer than 1 in. (25 mm) to the nearest point of tangency to a bell radius with a minimum insertion of 1 in. (25 mm) for lap-welded pipe or in accordance with the purchaser's documents (see Figure 4). The pull is further described as the dimension in which the pipe joint insertion varies when measured from opposite sides (180° apart). This pull shall not diminish the minimum required insertion dimension. By using this joint pull, pipe can be aligned with long-radius curves as well as minor offsets during pipeline construction.

4.4.4.4 Flanged joints. Flanges commonly used for steel water pipe are slip-on type ring flanges. Flanges are designed for use with rubber or nonasbestos gaskets. Both the size and type of gasket material are controlling factors in the design of bolted joints, and the AWWA Manual M11 and ANSI/AWWA C207 recommendations should be followed.

Regardless of the type of gasket being used or the materials of construction, certain basic procedures must be followed if the joint is to be assembled, tested, and easily put into operation. Regardless of the method used to apply stress to the bolts or studs, the following procedure should be followed carefully:

1. Inspect the gasket seating surfaces. Look for tool marks, scratches, or pitting by corrosion, and make sure that the gasket seating surface is appropriate for the type of gasket being used. Deep radial tool marks on a gasket seating surface are virtually impossible to seal, regardless of the type of gasket used. This type of damage shall be cause for rejection, and the flange shall be repaired or replaced.

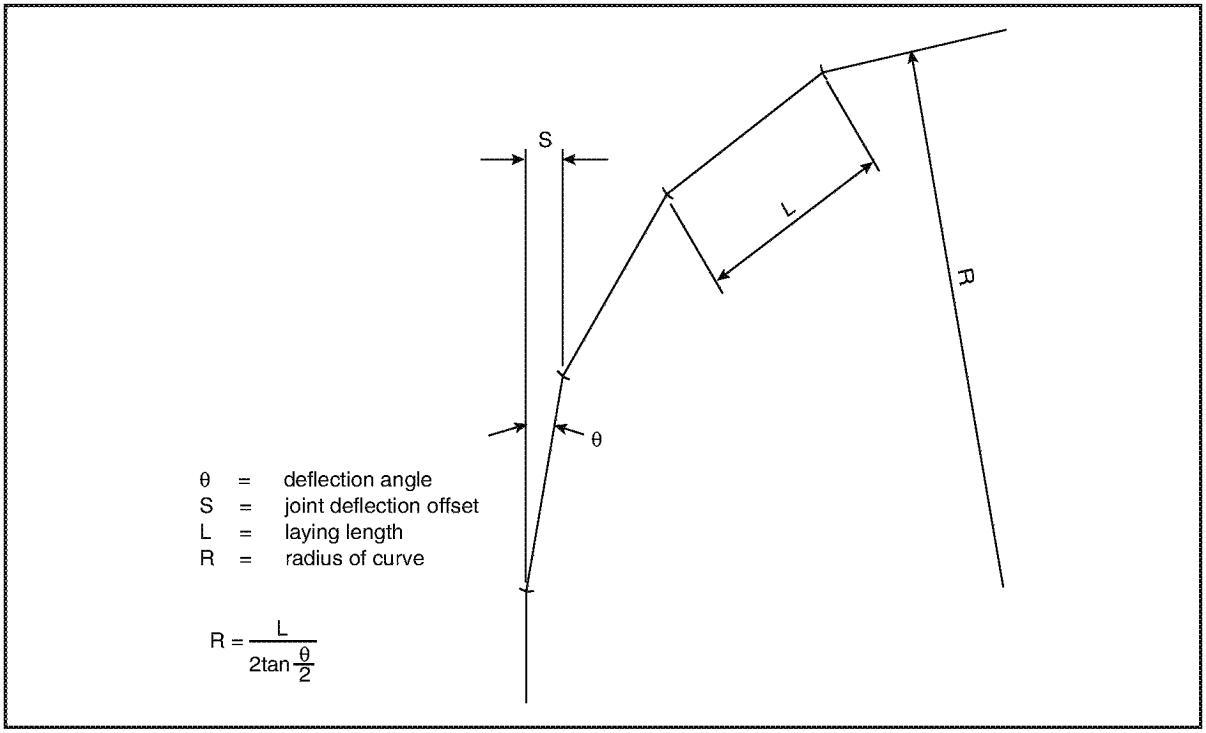

Figure 4 Joint deflection

2. Inspect the gasket. Confirm that the material is as required by the purchaser's documents, and look for defects or damage to the gasket.

3. Inspect and clean each stud or bolt, nut, washer, and the facing on the flanges against which the nuts will rotate. Look for severe galling, pitting, etc. If any of the above-mentioned items are damaged beyond repair, replace the item.

4. Lubricate all thread contact areas and nut facings. Do not construct the joint without applying the proper lubrication to the threaded surfaces and to the nut facings. The lubricant is necessary to provide a low coefficient of friction for installation and to achieve proper torque values.

5. With ring gasket installation, loosely install the stud bolts on the lower half of the flange. Insert the gasket between the flange faces to allow the bolts to center the gasket on the assembly. Install the remaining bolts and nuts.

With full-face gaskets, at least two bolts or studs must be placed in the top half of one flange, then the gasket placed over these bolts before mating the flanges. The remaining bolts and nuts can be installed to a hand-tight condition through the flange and gasket.

6. Torque the bolts up to a maximum of 30 percent of the final torque value required, following the recommended sequence shown in Figure 5. The recommended torque values are provided in AWWA Manual M11. Number the bolts

NOTES: 1. Patterns similar to the above are followed on larger flanges.
2. For insulating flanges, refer to the manufacturer's recommendations.

Figure 5 Bolt torque sequence

so that the torquing requirements can be followed. With any gasket material, it is extremely important to follow a proper bolting sequence.

7. Repeat step 6, increasing the torque to approximately 50 to 60 percent of the final torque value required.

Copyright © 2011 American Water Works Association. All Rights Reserved.
Provided by IHS
No reproduction or networking permitted without license from IHS
Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

8. Continue with a rotational pattern of retorquing all studs or bolts to the desired amount until no further rotation of the nuts can be achieved at the prescribed torque load. This may require several retorquings, because as one bolt is torqued, it will relieve the stress on the adjacent bolt until equilibrium is achieved.

4.4.4.5 Transition couplings. Transition couplings may be required for joining different types or sizes of pipe. Such transition devices are typically available. When ordering, the actual outside diameter of the pipe ends shall be given.

4.4.4.6 Tapping sleeves. Tapping sleeves are a means of making branch connections to existing pipelines. The procedures for proper installation of tapping sleeves shall follow the manufacturer's recommendations.

4.4.4.7 Sleeve couplings. Sleeve couplings are used on pipelines of all diameters. Follow the manufacturer's recommendations and ANSI/AWWA C219 for their installation.

4.4.4.8 Split-sleeve coupling. Split-sleeve couplings are used on pipelines of all diameters. Follow the manufacturer's recommendations and ANSI/AWWA C227 for their installation.

4.4.4.9 Welded joints. Welding shall meet the requirements of ANSI/AWWA C206 and the purchaser's documents for the project. The need for welded joints will vary by project and will be identified in the purchaser's documents. The single lap weld joint is the most commonly used configuration for joint restraint.

Joint welding procedures, welders, and welding operators shall be qualified under tests prescribed in ANSI/AWWA C206. Preheat and interpass temperature maintenance is often required prior to welding and during welding to prevent cracking. The specific preheat and interpass temperature maintenance requirements will vary depending on the welding process, steel specification, steel thickness, and metal temperature and should be determined by using AWS D1.1.

A protective cover shall be draped over the pipe near the vicinity of welding if protection of the coating is required. Field welding in the interior of steel pipe is ordinarily limited to 30-in. (750-mm) or larger pipe, to provide for access and egress. When personnel are working inside, ventilation shall be provided in strict accordance with federal, state or provincial, and local regulations.

Wire brushing is usually sufficient to remove any dirt or light rust to prepare the surface for welding. Small tack welds can be used to hold the pipe in position for welding, provided the tacks are sound and meet the requirements of ANSI/AWWA C206. The number of weld passes needed to complete the joint is a function of the steel wall thickness, type of joint, and type of welding. Interior welding

Copyright © 2011 American Water Works Association. All Rights Reserved.
Provided by IHS

Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

using the weld-after-backfill method may require more than one weld pass to limit temperature at the joint and damage to the exterior coating.

4.4.4.9.1 Welded lap joints. There are several welding configurations for the lap joint. The single lap weld joint is completed using a single weld that can be accomplished on either the inside or outside of the pipe joint. Inside welding is frequently limited to pipe diameters of 30 in. (750 mm) and larger. The nominal engagement of a lap-welded joint is 2 to 3 in. (50 to 75 mm) deep with a minimum required final overlap between the bell and the spigot after pullout of 1 in. (25 mm) or three times the thickness of the belled pipe, whichever is greater. The typical pullout is 1 in. (25 mm), but in all cases, the 1-in. (25-mm) minimum required overlap must be maintained. No part of any field weld shall be closer than 1 in. (25 mm) to the nearest point of tangency to a bell radius. The allowable angle of deflection is provided in Sec. 4.4.4.3.

4.4.4.9.2 Welded butt joint. Welded butt joints are sometimes specified for special design conditions. Butt joints are usually single-V-groove ends and can include a backup ring. The backup ring will be located on the pipe interior for smaller-diameter pipe and on the exterior or interior for larger pipe (over 30 in. [750 mm] in diameter). Field joints shall be assembled so that longitudinal seams in adjacent pipes are offset from each other by at least five times the thickness of the thicker of the pipes being joined. Single-V-groove butt joints may be welded from the outside of the pipe, or from the inside of the pipe if the diameter is large enough. The backing rings may be left in place after welding. Line-up clamps can assist in the pipe installation. The installation procedure of field-welded butt joints is basically identical to the above except that when the two ends have touched, caution should be exercised to ensure that the proper root opening is achieved and the pipe is firmly secured in position prior to installing subsequent pipe segments.

4.4.4.9.3 Welded butt-strap joints. Where welded butt-strap joints are used, the butt straps shall have a minimum plate thickness equal to the thinnest member being joined and shall be fabricated from steel listed in ANSI/AWWA C200 and meeting the purchaser's pipe design requirements. In accordance with ANSI/AWWA C206, the strap shall have a minimum width of 4 in. (100 mm) for pipe less than 24 in. (600 mm) in diameter and 6 in. (150 mm) for pipe 24 in. (600 mm) nominal diameter and larger. The minimum lap between pipe ends and the edge of the butt strap shall be 1 in. (25 mm) for pipe less than 36 in. (900 mm) in nominal diameter and 2 in. (50 mm) for pipe 36 in. (900 mm) nominal diameter and larger.

Not for Resale, 06/24/2014 14:10:54 MDT

For butt-strap joints, the longitudinal seams of adjacent pipe sections may be in alignment provided that the butt-strap seams are offset from the pipe seams by at least five times the thickness of the thicker member involved in the joint. The butt strap may be welded on the pipe exterior, interior, or both.

4.4.4.9.4 Welded joint testing. If required by the purchaser's documents, nondestructive joint testing is performed by visual inspection, magnetic particle, or dye penetrant testing of single-fillet welds, magnetic particle testing of butt-welded joints, or air testing of double-fillet welds. Vacuum look box testing has been used on a limited basis as an alternative method for fillet welds and butt welds. Radiographic testing and ultrasonic testing have been used on a limited basis as alternative methods for testing butt joints. Radiographic testing is not recommended for butt joints with backing and lap joints. The test method shall be specified in the purchaser's documents. These test methods and repair of defective welds are further described in ANSI/AWWA C206.

4.4.4.10 Pipe cutting. Prior to cutting, pipe shall be checked to ensure it is within the necessary tolerance for proper assembly with the adjoining pipe. If the adjoining pipes are not within the needed longitudinal tolerance, either replace the segment or use an alternative field joint such as a butt strap. Cutting pipe for insertion of valves, fittings, or closure pieces shall be done in conformance with all safety requirements. Cutting may be performed by a power abrasive saw, oxygen-acetylene torch, plasma arc, air-arc, or other suitable means. The resulting cut end will require corrective preparation before assembly with the adjoining pipe. Cut ends and rough edges shall be ground smooth.

4.4.4.11 Expansion joints. Provisions shall be made for the expansion and contraction of welded pipelines exposed to extreme temperature differential during installation. Failure to provide for this expansion and contraction can result in undesirable levels of thermal stress in the steel. Where individual pipe lengths are anchored and sleeve-type couplings are used for field joints, the joints must allow enough movement so that expansion and contraction is not cumulative over an excessive length. Thermal expansion is usually accommodated for trench-laid welded pipelines to avoid the accumulation of expansion and contraction during installation. These joints usually include a lengthened bell, which is welded during the coolest part of the day and only after all adjacent pipe has been welded and buried.

4.4.4.12 Bonding of joints. When required by the purchaser's documents, the bonding of nonwelded joints shall be used to make the line electrically

Not for Resale, 06/24/2014 14:10:54 MDT

continuous. Electrical continuity allows for monitoring of the pipeline. Electrical bonding jumpers may be welded in the field to provide electrical continuity between adjoining pipes. The bond welds should be kept close to the ends of the pipe to allow joint end coatings to cover the bonding jumpers.

4.4.4.13 Protective coatings at field joints. Generally, pipe lengths are coated and lined in the shop, excluding only the pipe ends that are completed in the field. After field assembly, the exterior and interior joint ends shall be completed with coatings that are compatible with the original coating system of the pipe and in conformance with the applicable AWWA standards. The type of pipe coating and end coating shall be determined by the purchaser's documents. Various pipe end coatings and linings are available, which are further described in ANSI/AWWA C203, ANSI/AWWA C205, ANSI/AWWA C209, ANSI/AWWA C210, ANSI/AWWA C216, ANSI/AWWA C217, ANSI/AWWA C222, and ANSI/AWWA C602. For application and repair of these materials, follow the appropriate AWWA standard and the manufacturer's recommendations. Three commonly used materials for pipe end field coatings are heat-shrink sleeves (ANSI/AWWA C216), hand-applied tape (ANSI/AWWA C209), and hand-applied cement mortar (ANSI/AWWA C205). Field joint and repair applications for these materials are briefly described by this standard.

4.4.4.13.1 Tape wrapping field joints. Tape is provided in various widths for various needs but is generally 6 to12 in. (150 to 300 mm) wide. Taping can be completed at any temperature as long as the roll body temperature of the tape is maintained above 70°F (21°C). The procedure for proper tape wrapping of field joints is fully described in ANSI/AWWA C209 and is summarized as follows:

1. Make sure the joint to be taped is complete, the gasket is checked, the weld is inspected, and the metal is cool to a temperature below 130°F (54°C).
2. Clean the area to be taped to make sure all moisture has been removed.
3. Prime all around the joint, including several inches on both sides beyond the area where the actual joint tape will be applied. Place filler material at all pipe joints and at irregularities to create a smooth surface. (Lap welds, where the exterior is a full thickness weld, and butt welds do not require filler material.)
4. Start in a downhill direction of the pipe and wrap two complete layers around the pipe until overlapping the starting point by a minimum of 4 in. (100 mm). Cut the tape so as not to damage the field coating. The start and stop spots do not need to be much farther than 10° to 15° from the top centerline.

Not for Resale, 06/24/2014 14:10:54 MDT

5. Make sure the tape around the joint is wrinkle-free and stretched taut. It is preferable to keep the welded bonding jumper close to the pipe ends and wrap the whole area with the tape as the joint is wrapped.

6. Make sure that partial rolls of tape go around at least one complete wrap.

7. Inspect the completed wrap using a holiday detector.

4.4.4.13.2 Taped pipe repairs. Many taped pipelines include a three-layer system. The first layer that actually bonds to the pipe is typically a black tape. The second layer is a higher-density tape to give durable protection during handling and service. The third layer is a tape that provides good protection to the inner layers of tape. In most cases, this outer layer is white. The three layers are generally supplied in three different colors so that in the event of damage, the colors will assist in determining the extent of damage to the total tape system. The procedure for properly taped pipe repairs is fully described in ANSI/AWWA C209 and is summarized as follows:

1. Minor wrinkles, scuffs, or any tears located on the edge of the tape that do not go past the overlap area are generally acceptable. These conditions listed still give the tape a full film thickness, and it is not practical to remove the high-density machine-applied tape and replace it with a softer patch-type material.

2. If a tear occurs in only the outer layer, repair the damaged area with one layer of tape with a minimum overlap of 4 in. (100 mm) onto the existing coating system.

3. If the damaged coating area shows evidence of going further into the coating system, use the repair method outlined below.

a. Cut away the damaged tape at an angle tangent to the surface of the pipe so that the tape system is not cut or damaged any further.

b. Wipe clean the area to be taped and make sure it is dry and free from dirt.

c. Prime the area to be repaired and let the primer dry to a tackiness before applying the repair tape. The primed area shall be of sufficient size to extend beyond all applied patch tape.

d. Cut the tape to such a size that it extends beyond the damaged area for a minimum of 4 in. (100 mm) in all directions around the area to be repaired. Apply the tape starting at the center and working toward the edge, making sure to smooth out all wrinkles. Make sure the primed area extends past the tape edges.

e. Only one layer of repair tape is required on damages that affect the outer layer of tape. If a second layer of tape is required to complete the patch, place the second layer of patch material over the first extending a minimum of 1 in.

(25 mm) in all directions past the first layer patch. It will always require two pieces of tape to accomplish this overlap process.

f. Perform a holiday test on the repair area.

4.4.4.13.3 Heat-shrink sleeves on field joints. Heat-shrink sleeves are used to protect field joints from moisture and oxidation. The procedure for proper application of heat-shrink sleeves is fully described in ANSI/AWWA C216 and is summarized as follows:

1. Clean the area of the heat-shrink sleeve to remove all moisture, soil, and foreign materials.

2. If required by the heat-shrink sleeve installation instructions, place filler material at pipe joints and at irregularities to create a smooth surface. If required by the heat-shrink sleeve installation instructions or purchaser's documents, abrade polyurethane coatings (tape systems do not need to be abraded) and/or preheat the joint as required.

3. Fit the sleeve around the joint.

4. Heat the sleeve to shrink and seal the sleeve to the joint.

5. Using rollers, remove all wrinkles to ensure that the sleeve has intimate contact with the pipe.

4.4.4.13.4 Cement mortar for field joints and repairs. Pipe ends and areas needing repairs shall be clean of deleterious materials and the surface prepared for the cement mortar in accordance with ANSI/AWWA C205. When feasible, interior cement mortar for field joints and repairs shall be applied after the trench has been backfilled. Typically for 24 in. (600 mm) and larger diameters, the inside recess is pointed with mortar. On smaller diameters, the shoulder of the bell is "buttered" with a stiff mortar, and a swabbing device, such as an inflated rubber ball wrapped with burlap, is placed in the previously laid section of the pipe. The ball has a wire attached to it, and the wire is threaded through the next pipe section to be laid. When the sections are joined, the spigot squeezes the mortar into position against the shoulder of the bell. Then the swabbing device is pulled past the joint by means of the wire, and the excess mortar is wiped away, leaving a smooth, flush inside joint. For exterior joints, cement mortar shall be poured in the joint space through a grout band that is wrapped around the joint and firmly strapped onto both sides after field joint assembly. Repairs to the exterior mortar coating of the pipe shall be made during pipe installation and before backfilling. Cracks in cement–mortar-lined steel pipe are a common occurrence. These cracks are most commonly shrinkage cracks, which are caused when the mortar dries out.

--`,,`,,`,,

Contributing factors may be unprotected pipe ends, rough handling, or thermal stresses caused by weather. It is important to keep the pipe ends capped; small amounts of water can be added to the inside when the pipe is subjected to hot, dry climates. Cracks of 1/16 in. (1.6 mm) or less are acceptable by ANSI/AWWA C205. If cracks exceed 1/16 in. (1.6 mm), a slurry mixture can be brushed over the cracked area prior to filling the pipeline. The material requirements and application procedures of cement mortar for field joints and general repairs are described in ANSI/AWWA C205. Do not fill pipe for 72 hr after the last concrete repair.

4.4.5 *Thrust restraint.* The need for thrust restraint is a design consideration that is not covered by this standard. Such restraint typically is provided by welded joints.

4.4.6 *Backfilling.* It is important to identify components of the trench and recognize how they relate to the overall backfilling process and material requirements. Pipe bedding, haunch zone, initial backfill, and final backfill materials are project-specific and can be composed of different materials with varying compaction levels. Subgrade improvement is typically only required when unacceptable material causes an unstable trench bottom. The subgrade improvement depth (if required) is generally specified or directed by the purchaser. Pipe bedding is typically 2 in. to 6 in. (50 mm to 150 mm) in depth directly under the pipe and is loosely consolidated to provide uniform support for the pipe. The haunch zone begins at the bottom of the pipe and is typically placed to a depth of up to 1/3 of the pipe diameter. Haunch area materials are typically the same material as the initial backfill. Proper installation of the haunch zone material provides uniform support of the pipe and has the greatest impact on limiting deflection of the pipe. Voids in the haunch zone of the pipe are unacceptable. Initial backfill typically begins at the top of the bedding or haunch zone and continues to the top of the pipe. Final backfill begins at the top of the initial backfill and proceeds to finished grade. The purchaser should specify if the initial backfill is to be placed above the top of the pipe. Placing initial backfill over the top of the pipe provides a consistent environment encapsulating the pipe, which may aid in the corrosion protection of the pipe. For this case, the initial backfill is typically placed 6 in. (150 mm) over the top of the pipe for pipe smaller in diameter than 24 in. (600 mm) and 12 in. (300 mm) over the top of the pipe for pipe 24 in. (600 mm) in diameter and larger. Typically acceptable final backfill material and compaction requirements are detailed in purchaser's documents, but in all cases, stones or rocks larger than 3 in. (75 mm) in diameter for mortar-coated pipe and 3/4 in. (19 mm) in diameter for dielectric-

Not for Resale, 06/24/2014 14:10:54 MDT

coated pipe may damage the coating and shall not be placed in direct contact with the pipe. From 6 in. to 12 in. (150 to 300 mm) above the top of the pipe to finish grade, material containing stones up to 8 in. (200 mm) in their greatest dimension may be used.

4.4.6.1 Pipe embedment and subgrade material. When the type of backfill material is not specified by the purchaser, the excavated material may be used provided the material meets the requirements of this standard. All pipe embedment and subgrade material shall be free from cinders, ashes, refuse, vegetable or organic material, frozen soil, boulders, rocks or stones larger than 3 in. (75 mm) in diameter for mortar-coated pipe and ¾ in. (19 mm) in diameter for dielectric-coated pipe, or other unsuitable materials.

4.4.6.1.1 Initial backfill may be class SC1, SC2, and SC3, see Table 1, and shall be densified around the pipe in accordance with Figure 6. Minimum density levels of the backfill are important in preventing deflection of the pipe. The density shall be specified by the purchaser or shall be as determined in AWWA M11 by the soil class used and the recommended pipe deflection limits. Regardless of the method of densification used, materials shall be brought up at substantially the same rate on both sides of the pipe. When installing pipe 36 in. (900 mm) and larger, confirm that the backfill properly supports the pipe haunch area. Take care to ensure that the pipe is not floated or displaced before backfilling is complete.

Pipe deflection should be monitored to verify that the proper installation techniques are being used.

4.4.6.1.2 Cohesive soils shall be compacted with mechanical equipment or hand tamping. Care shall be taken not to damage coatings during compaction. Proper equipment and care in placement will ensure the required compaction under the haunch of the pipe. Initial backfill for pipe up to 48 in. (1,200 mm) in diameter shall be placed in layers of not more than 12 in. (300 mm) in thickness. Initial backfill for pipe larger than 48 in. (1,200 mm) in diameter shall be placed in layers not exceeding 24 in. (600 mm) in thickness and subject to meeting the compaction requirements.

4.4.6.1.3 Free-draining soils may be densified by mechanical equipment, hand tamping or tamping with water-using devices, or through methods such as water jets, immersion-type vibrators, or flooding. These soils are usually placed in a minimum of two layers, with the first layer placed loose to no higher than the spring line of the pipe. The thickness of the layers shall not exceed the penetrating depth of the vibrators if consolidation is performed by jetting and internal vibration.

4.4.6.1.4 Final backfill above the pipe embedment shall not be placed until the compaction of the pipe embedment backfill is satisfactorily complete. To prevent damage to the pipe, sufficient compacted backfill shall be placed over the pipe before allowing any type of vehicle over it.

NOTE: Loosely placed final backfill above the pipe may promote unwanted surface settlement, which could be detrimental to improvements subsequently placed over the trench.

4.4.6.2 Compaction. Care shall be taken to ensure compaction equipment does not damage the pipe coating. Ensure proper compaction of backfill to avoid ovalling of the pipe beyond the required limits.

4.4.6.3 Partial backfilling during testing. Newly installed pipelines are normally tested after backfilling. When unusual conditions require that pressure and leakage testing be accomplished before completion of backfilling, or with pipe joints accessible for examination, sufficient backfill material shall be placed over the pipe barrel between the joints to prevent movement, and due consideration shall be given to restraining thrust forces during testing.

4.4.7 *Flushing.* Foreign material left in pipelines during installation can result in valve or hydrant seat leakage during pressure tests. Every effort shall be made to keep lines clean during installation. Thorough flushing is recommended prior to a pressure test; flushing shall be accomplished by partially opening and closing valves several times under expected line pressure, with flow velocities adequate to flush foreign material out of the valves.

4.4.8 *Disinfection.* Newly installed mains carrying potable water shall be disinfected in accordance with ANSI/AWWA C651. Provisions shall be made to avoid contamination of existing mains by cross connection during testing/disinfection/flushing of newly installed mains.

NOTE: Discharge from flushing or disinfection shall be directed away from the pipe alignment so that trench stability is not affected and shall be in accordance with federal, state, and local point discharge requirements.

4.4.9 *Highway and railroad crossings.*

4.4.9.1 Casing pipe. When casing pipe is specified for highways or railroad crossings, the project shall be completed in accordance with applicable federal, state or provincial, and local regulations. In the case of railroad crossings, the project shall also comply with regulations established by the railroad.

4.4.9.2 Carrier pipe. The casing pipe and other pipe appurtenances shall be a minimum of 8 in. (200 mm) larger than the outside diameter of the steel pipe

Copyright © 2011 American Water Works Association. All Rights Reserved.

Not for Resale, 06/24/2014 14:10:54 MDT

bells to prevent damage during installation and to prevent pipe-to-casing contact. Carrier pipe may be pushed or pulled through the completed casing pipe. Spacers and/or insulator skids shall be placed around the carrier pipe to ensure approximate centering within the casing pipe and to prevent damage during installation or flotation. Care shall be exercised to avoid metal-to-metal contact. If the casing annulus is grouted, grout pressures and lifts must be maintained to avoid deflecting or collapsing the steel carrier pipe. Carefully monitor the carrier pipe during the grouting operation to verify the proper grouting techniques are being used.

4.4.10 *Subaqueous crossings.*

4.4.10.1 Subaqueous installations. When it is necessary to cross a body of water, the preferable practice is to dewater the area and proceed according to the conventional pipeline construction practices described in this standard. In the event the purchaser's documents allow subaqueous construction, the constructor is strongly advised to use an engineered system specifically developed for the pipe, crossing depth, intended cover, and means planned for such a crossing. The use of a restrained-type joint (welded or mechanical) is recommended. However, the additional details necessary for subaqueous construction are not covered in this standard.

SECTION 5: VERIFICATION

Sec. 5.1 Inspection

5.1.1 *Inspection on delivery.* All pipe and appurtenances are subject to inspection at the point of delivery. Material found to be defective because of manufacture or damage in shipment shall be recorded on the bill of lading and may be rejected. There shall be agreement between the purchaser and constructor regarding any necessary repairs. The purchaser shall be allowed to monitor the repairs prior to installation.

Sec. 5.2 Hydrostatic Field Testing

WARNING: The testing methods described in this section are specific for water-pressure testing. These procedures shall not be applied for air-pressure testing because of the serious safety hazards involved.

The main objective of a field hydrostatic pressure test (hydro test) is to check the watertightness of joints, as each length of pipe is shop tested per purchaser's documents. The hydro test can be performed after backfilling is complete and

Copyright © 2011 American Water Works Association. All Rights Reserved.

Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

at a purchaser-specified pressure above the design working pressure of the line. Where possible, bolted flexible joints should be left uncovered until the hydro test is complete.

5.2.1 *Test restrictions.* Test pressure shall not exceed 125 percent of working pressure unless taken into consideration in the design and shall never exceed pipe or thrust-restraint design pressures. The line shall be vented and care shall be taken to ensure that all air in the line escapes during the filling operation. The line shall be filled slowly to prevent water hammer.

Upon completion of filling with water, the hydrostatic test shall last at least 2 hr. Pipe with cement–mortar linings should be filled for a minimum of 24 hr prior to testing to allow for water absorption into the lining. Water absorption into linings and other factors may extend the duration required for a successful hydro test.

5.2.2 *Air removal.* Before applying the specified test pressure, air shall be expelled from all air vents along the section of piping being tested.

5.2.3 *Examination.* Any exposed pipe, fittings, valves, and joints shall be examined carefully during the test. In addition, the entire length of the pipeline shall be examined for movement, defects, and leaks that may appear at the surface. Any revealed damage or defective pipe, fittings, valves, or joints shall be repaired or replaced with sound material, and the test shall be repeated until satisfactory results are obtained.

5.2.4 *Allowable makeup water.* Makeup water shall be defined as the quantity of water that must be supplied into the newly laid pipe or any valved section thereof to maintain pressure within 5 psi (34.5 kPa) of the specified test pressure after the pipe has been filled with water and the air has been expelled. Makeup water shall not be measured by a drop in pressure in a test section over a period of time.

The allowable makeup water shall not exceed 10 gal per in. diameter per mi of pipe per 24 hr (0.93 L per mm diameter per km of pipe per 24 hr) as measured by the water required to maintain the specified test pressure.

NOTE: The air removal and test procedure above will expel most but not all air from the pipeline. This section assumes some air will remain in the pipeline during testing and provides for this condition.

5.2.5 *Valve seat leakage.* When testing against closed valves, makeup water per closed valve of 0.0078 gal/hr/in. (1.2 mL/hr/mm) of nominal valve size shall be allowed. This is in addition to the makeup water in Sec. 5.2.4. When testing against existing valves is necessary, some leakage can be expected and should not be the sole basis for rejection.

Licensee=AECOM User Geography and Business Line/5906698001, User=Gossiaux, Thoma
Not for Resale, 06/24/2014 14:10:54 MDT

5.2.6 *Acceptance of installation.* Acceptance shall be determined on the basis of the hydro test. If any test of laid pipe requires makeup water greater than that specified, repairs or replacements shall be accomplished and the pipe retested.

5.2.6.1 All visible leaks shall be repaired regardless of the amount of leakage.

SECTION 6: DELIVERY

Sec. 6.1 Unloading, Handling, and Storage

Care shall be exercised when unloading, handling, and storing pipe. Nylon or protected slings at least 4 in. (100 mm) wide or padded forks shall be used to handle coated pipe. Cables, chains, ropes, or other equipment that is likely to damage pipe coatings shall not be used.

Coated pipe shall be handled, stored, and shipped in a manner that will prevent damage to the coating. If the coating is damaged during handling, storage, or shipping, it shall be repaired with the original or a compatible repair coating as recommended by the coating manufacturer and in accordance with the applicable AWWA standard.

All pipe, fittings, and accessories shall be loaded and unloaded carefully to avoid impact or damage. Under no circumstances shall such material be dropped.

6.1.1 *Secure pipe.* Before release of tie-downs around the pipe, the loads shall be checked to ensure the pipe is secure and stable.

6.1.2 *Padding.* Slings, hooks, and pipe tongs shall be padded and used in such a manner to prevent damage to the exterior surface or internal lining of the pipe, fittings, or related product.

6.1.3 *Internal bracing.* Pipe manufacturers provide internal bracing for handling and shipping purposes if required. The constructor should maintain the bracing and ensure its adequacy during installation. This bracing may or may not be adequate to limit pipe deflection during backfilling operations. The purchaser should specify the requirements for bracing if its use is desired to limit pipe deflection during backfilling.

6.1.4 *Jobsite storage.* Stored materials shall be kept safe from damage. The interior of all pipe, fittings, and other appurtenances shall be kept reasonably free from dirt or foreign matter at all times.

Coated pipe shall be protected from ultraviolet and weathering damage as recommended by the coating manufacturer. Coated pipe should never be placed,

dragged, or rolled directly on the ground. Padded skids, earthen berms, burlap sacks filled with sand, and old car tires are some of the means to adequately bunk the pipe at the jobsite. Pipe shall not be stacked without proper padding. Plastic caps on the pipe ends for pipe that is cement–mortar lined shall be left in place until just prior to installation.

Sec. 6.2 Affidavit of Compliance

The purchaser may require an affidavit of compliance or test reports from the constructor stating that the material installed or tests performed comply with all applicable requirements of this standard.

Attachments: Plants with Lime Addition #2.xls

Hi Rick,

Attached is a list of the "lime plants" in Michigan. The last column has a brief description of how they dispose of their lime sludge. Hope this helps.

When I get the info for Adrian, I'll forward it to you.

Subject: RE: Water Treatment Plants

Now that I am looking at this further, would it take much effort to check with the districts? I would need an answer before the end of the week to meet my deadline. We are working on answering interrogatories in the court case. The question would just be which of these use lagoons for their residuals.

Hi Rick,

Attached is a list of water plants that use lime as part of the treatment process. However, it does not include, nor does any database we have contain the information about how these plants store or get rid of the lime residuals/sludge. (I know Howell, MHOG and East Lansing Meridian Two have pond or lagoons, but I'm not sure about the others.)

I can get the info you are looking for from the districts if needed.

Pat, I am working on the Plainfield Township lawsuit regarding their discharge of lime residual sludges to the Coit Avenue Pit. Mike Bolf suggested I check with you. Is there a way to generate a list of all the municipalities in the state that have lime residual lagoons as part of their treatment system?

Hi Mike,

As I mentioned earlier today during our phone conversation, I have no objections with KWA wanting to use a more conservative leakage formula for the pipeline rather than what is in AWWA 604. If they want to hold their contractors to a higher criteria, I'm not going to stop 'em.

Regarding the welded joints, I don't think they need to included them in the formula as long as the welds are tested by some other acceptable means such as radiography, sonograms, or magnetic particle testing. Also, by not including the welded joints in the below formula, it will result in an even lower allowable leakage than if they used them.

pat

Subject: FW: Contract S-4002 100% and S-4003 90% Submittals - MDEQ comments

Pat,

The leakage calculation has surfaced again with respect to the KWA pipeline project. Initially, Genesee County was agreeable to using the AWWA C-604 leakage formula; however, after making further calculations they feel that the formula which uses the number of joints (L (g/hr) = JD sqrtP/7400) is far more conservative than the allowable leaking from C-604 and they wish to hold their contractors to that. On the surface, the joint formula appears more conservative; however, they base it on the assumption that the welded joints do not count. If we include all of the welded joints, the allowable leakage is rather close between each formula – depending on pipe length. I will verify the allowable leakage based on actual pipe length and all joints (welded and appurtenances) for comparison. Daryl and I would like to confirm the validity of their assumption.

Subject: RE: Contract S-4002 100% and S-4003 90% Submttals - MDEQ comments

I would like to revisit the conversation this morning regarding the pressure test. The new leakage method based on AWWA 604-11 the 66" pipe would allow 55 gal/mile leakage in a 2 hour period. The current specified method in section 02315 would allow roughly 0.2 gal/mile leakage in a 2 hour period depending on the pressure (150 to 350 psi) and the(J) number of joints 1 per mile to 12 per mile (welded joints do not count so only the valves count on the 66" line, but if you count the hydrants, and air release valves, which are not normally counted, it could be 6-12 per mile depending on the section). Note that you would have to have about 165 joints per mile (an average of 1 joint every 32 feet) @ 350 psi to equal the 55 gal per 2 hours allowed by the new formula. For 150 psi, it would have to have the equivalent of 252 joints per mile to get the 55 gal leakage in 2 hours that is allowed by the new method. The current specification indicates to test at the pressure equal to the pressure class listed on the drawings, where the new version would say test at no more than 125% of the working pressured. The working pressure is not defined anywhere so is that the pressure class of the pipe, or the pressure within the pipe that is expected during operation?

The 60" would be somewhat similar to the 66", except the pressures would be lower on the 60" pipe.

With that being said will the MDEQ allow the current specifications to remain or do we need to still reference AWWA 604-11 for testing even though the allowable leakage is well above what we are allowing.

Subject: Contract S-4002 100% and S-4003 90% Submttals - MDEQ comments

We've completed the review of both projects and the only significant issues that resulted were the Leakage Test formulas that Mike Prysby identified in his review of S-4005. When the corrected specs are received, I am prepared to issue the permit for S-4002. If I have them by early afternoon on Monday, June 23rd, I can bring the permitted plans and specifications to the June 24th meeting. I'm willing to replace the corrected section of the spec into the previously submitted specs if that is easier. Emailing them to me would be fine.

Thanks,

Subject: RE: Bray road consent order

Rich,

In response to Mr. Robinson's request to copy language from the Statement of Purpose and create a Section 3.13 in the Compliance Program, I have drafted the following language:

3.13
Public improvement projects under Act 399 required to be completed by the Respondent to receive water from KWA, continue to use the Flint River, or obtain a back-up water supply in order to comply with Act 399, shall not initiate construction, alteration, addition or improvement until the Respondent has obtained a valid construction permit(s) from the ODWMA issued under Section 4 of Act 399.

Copying the language word for word would not appear to comply with compliance program requirements, so I have attempted to restate the language in a manner that may fit within the compliance program structure. This draft language should also relieve OWMRP from any implied authority under Act 399, by directing the respondent to ODWMA for Act 399 compliance.

Hope that works.

Subject: RE: Bray road consent order

He doesn't appear to understand the difference between WRD and OWMRP.

I don't see a need to make any of the modifications, other than modified dates. I also wouldn't move the DW stuff in the Statement of Purpose to a new 3.13.

Subject: Flint WTP update

Steve,

Just a quick update on the Flint WTP operation. WTP operators started intermediate chlorination last night around 11pm and a residual of 1.6 ppm (free) is being measured at the bottom of each filter today. Filter effluent turbidities are between 0.03 and 0.04 NTUs and finished water hardness is around 160 ppm (raw water hardness is in the 210 to 220 range). The solids contact units are having bit more carry-over to the filters than desired, but maintaining blanket. WTP staff will investigate different polymers to improve softening performance. Filter bacteriological samples were collected earlier and the results will be available on time for tomorrow's switch-over.

*** Just received notice that the "switch-over ceremony" is now scheduled for 2pm, not 12-noon. The mayor is not available at 12 noon. I will plan to arrive at the WTP around 1:30 to 145ish.

Subject: Flint

Thank you again, Mike, for talking to me about the Flint water issue. I really like your idea of encouraging the City to do some customer service with the citizens that are complaining about the water. Flushing their line and/or taking a sample at the citizen's house might go a long way to calming people down.

I was also thinking about you doing a chain of custody sample at the plant. I know you trust Brent the operator; but this could be another response to customer complaints to instill trust in the water department. It wouldn't have to be compliance sampling; a special purpose sample perhaps.

Something else I thought of—Ohio is having issues of blue-green algae/cyanotoxins in some of its surface waters, which are related to taste and odor, and can cause rashes; pretty nasty stuff. Don Moore said that the Flint River does have a lot of algae growing on it. See the email below, with some websites on the issue of cyanotoxins in drinking water

The person at Ohio EPA that has dealt with blue-green algae/cyanotoxins in drinking water is Heather Raymond. She might be a good resource to discuss whether it would be worth sampling and analyzing for cyanotoxins in the Flint finished water.

FYI, Don Moore said he was organizing a protest picket line in his neighborhood at the water treatment plant.

Subject: HABs info

Hi, Jennifer.

Here are a few HABs websites. Both Ohio and Illinois have taken samples at systems and sources where problems have been reported, and I'm not sure about the other states.

U.S. EPA cyanobacterial HABs website: http://www2.epa.gov/nutrient-policy-data/cyanobacterial-harmful-algal-blooms-cyanohabs; Lesley D'Anglada from the EPA Office of Water's Office of Science and Technology also sends out HABs news updates that people can sign up for by contacting her (see forwarded e-mail below)

Ohio EPA's HABs—information for PWSs website: http://epa.ohio.gov/ddagw/HAB.aspx; Ohio EPA has a PWS HAB response strategy (http://epa.ohio.gov/Portals/28/documents/HABs/PWSHABResponseStrategy.pdf) in which they list Heather Raymond as the PWS HAB Coordinator—her contact information is heather.raymond@epa.ohio.gov and (614) 644-2911. Ohio has experienced the most problems in our region.

Illinois EPA's HABs and algal toxins website: http://epa.state.il.us/water/algal-bloom/index.html; Illinois just launched this program last summer

IDEM's blue-green algae website: http://www.in.gov/idem/algae/

MDH's blue-green algal blooms and microcystin website:
http://www.health.state.mn.us/divs/eh/hazardous/topics/bluegreenalgae.html

WDNR's blue-green algae website: http://dnr.wi.gov/lakes/bluegreenalgae/?a=1

Please let me know if you have any questions.

House Science Panel OKs Bill to Enhance Research, Control Efforts for Algae Blooms

A House committee approved by voice vote May 21 the *Harmful Algal Bloom and Hypoxia Research and Control Amendments Act* (S. 1254) to authorize a national strategy of research, mitigation and control for algal blooms that kill fish and shellfish by depleting oxygen in marine and freshwater bodies. The bill was approved by the Senate in February. It still must make it through the House Natural Resources Committee before it can go to the full House.

Steve,

Thanks for the table. Flint passed the info on to me earlier today.

I see a discrepancy between your table and Flint's records and we have used Flint's data in the report. I have double checked the lab results and I believe the error is on your end, but that is something to resolve. I've attached what I believe is correct. We have already printed and sent out the report since it is due to you guys Sunday. Samir is hand delivering and will probably be by soon.

Dear Drinking Water Laboratory Client,

A PDF file containing your analytical results has been attached to this e-mail.

Please do not reply directly to this e-mail. It is an automated account that does not respond to incoming messages.

Please contact the laboratory directly at (517) 335-8184 with questions regarding your report.

Thank you for using the MDEQ Drinking Water Laboratory.

Dear Drinking Water Laboratory Client,

A PDF file containing your analytical results has been attached to this e-mail.

Please do not reply directly to this e-mail. It is an automated account that does not respond to incoming messages.

Please contact the laboratory directly at (517) 335-8184 with questions regarding your report.

Thank you for using the MDEQ Drinking Water Laboratory.

Dear Drinking Water Laboratory Client,

A PDF file containing your analytical results has been attached to this e-mail.

Please do not reply directly to this e-mail. It is an automated account that does not respond to incoming messages.

Please contact the laboratory directly at (517) 335-8184 with questions regarding your report.

Thank you for using the MDEQ Drinking Water Laboratory.

Dear Drinking Water Laboratory Client,

A PDF file containing your analytical results has been attached to this e-mail.

Please do not reply directly to this e-mail. It is an automated account that does not respond to incoming messages.

Please contact the laboratory directly at (517) 335-8184 with questions regarding your report.

Thank you for using the MDEQ Drinking Water Laboratory.

Dear Drinking Water Laboratory Client,

A PDF file containing your analytical results has been attached to this e-mail.

Please do not reply directly to this e-mail. It is an automated account that does not respond to incoming messages.

Please contact the laboratory directly at (517) 335-8184 with questions regarding your report.

Thank you for using the MDEQ Drinking Water Laboratory.

Report To: STEVE BUSCH
525 W ALLEGAN
LANSING MI 48909

System Name/Owner:		WSSN/Pool ID:		
Collection Address:	FREEMAN ELEMENTARY SCHOOL,FLINT	Source:	Other	
Collected By:	JOE MADZIAR/ ANDY NEUMAN	Site Code:	F02	
Township/Well#/Section:	//	Collector:	Other	
County:	Genesee	Date Collected:	10/24/2015	10:10
Sample Point:	CF029 DHF OFFICE	Date Received:	10/24/2015	14:27
Water System:	Other	Purpose:	Other	

Sample Comment LF88818 The sample was collected using a 125 ml plastic bottle.

TESTING INFORMATION			REGULATORY INFORMATION			
Analyte Name	Result (mg/L)	Date Tested	RL (mg/L)	MCL/AL (mg/L)	Method	CAS #
Copper	Not detected	10/26/2015	0.05	1.3	EPA 200.8	7440-50-8
Lead	Not detected	10/26/2015	0.001	0.015	EPA 200.8	7439-92-1

The analyses performed by the MDEQ Drinking Water Laboratory were conducted using methods approved by the U .S. Environmental Protection Agency in accordance with the Safe Drinking Water Act, 40 CFR parts 141-143, and other regulatory agencies as appropriate.

Your local health department has detailed information about the quality of drinking water in your area. If you have concerns about the health risks related to the test results of your sample, please contact the Environmental Health Section through the address and telephone number listed below:
